

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

CONTENTS

OF THE
REGISTRAR GENERAL'S ANNUAL REPORT FOR 1873.

REPORT :—	PAGES
GENERAL REVIEW of FACTS for the Year	v
EMIGRATION from the UNITED KINGDOM	v
INCREASE of POPULATION and INFLUENCE of EMIGRATION thereon	v-vi
METEOROLOGY at GREENWICH; PRICES of WHEAT, MEAT and POTATOES; and PAUPERISM	vi-vii
MARRIAGES. Number celebrated according and <i>not</i> according to the Rites of the Established Church; Conditions of Persons married; Ages of Persons married; Marriages of Minors; Signatures of Marriage Registers; Educational condition of different Counties, as shown by the Signatures of Marriage Registers; Buildings registered for the Solemnization of Marriages; Certified Places of Worship; Designations of Religious Bodies	vii-xi
BIRTHS. Number registered; Birth-rate; Sex; Children born <i>in</i> and <i>out</i> of Wedlock	xi-xii
DEATHS. Number registered; Death-rate; Sex; Age; Mortality of Males and Females at various Ages; Seasons; Locality; Death-rate of Children under Five Years of Age, and under One Year of Age; Mortality from Fever in large Towns; Deaths in Public Institutions	xiii-xviii
PUBLIC HEALTH ACT	xiii
PROGRESS of REGISTRATION. Aggregate Number of NAMES on the REGISTERS, Particulars as to the Alphabetical Index to the Names, and NUMBER of SEARCHES in the Registers and of CERTIFICATES granted at the CENTRAL OFFICE	xviii
UNITED KINGDOM. Population, Emigration, Marriage, Birth, and Death Rates	xviii-xix
THE ARMY. STRENGTH and MORTALITY of the ARMY at HOME and ABROAD	xix
THE NAVY. STRENGTH and MORTALITY of the NAVY	xix-xx
BIRTHS and DEATHS of BRITISH SUBJECTS at SEA; MARINE REGISTER BOOK; MORTALITY by DROWNING in the MERCHANT SERVICE compared with that in the ROYAL NAVY	xx-xxi
WILLS. Calendars of Grants of Probate and Administration kept at the General Register Office; Numbers and Values of Probates and Administrations	xxii
EUROPEAN STATES. Marriage, Birth, and Death Rates; and Increase or Decrease of Population	xxii-xxv
SUMMARY of the QUARTERLY REPORTS :—	
FIRST QUARTER, ending 31st March	xxvi-xxxiii
SECOND QUARTER, ending June 30th	xxxiii-xli
THIRD QUARTER, ending September 30th	xli-xlvi
FOURTH QUARTER, ending December 31st	xlvi-lxii
HEALTH of LONDON and of other large Cities	lx-lxii
METEOROLOGY; Remarks by James Glaisher, Esq., F.R.S.	lxiii-lxiv
PRELIMINARY TABLES	lxvi-cxxviii

ABSTRACTS:—

MARRIAGES Registered in England in each of the Registration Divisions and Counties, and Districts; distinguishing those according and those <i>not</i> according to the Rites of the Established Church; in each quarter of the year; and distinguishing also Persons married according to their conjugal Condition, Minority, and Signature of the Register by marks	2-25
AGES of 300,262 Persons married, distinguishing those of Bachelors, Spinsters, Widowers, Widows	26-28

ABSTRACTS—continued.

	PAGES
MARRIAGES, BIRTHS, and DEATHS Registered, and Excess of Births over Deaths, in each of the Divisions, Counties, and Districts; also BIRTHS and DEATHS and EXCESS of BIRTHS over DEATHS in each of the Sub-districts of England; distinguishing the Sexes and Illegitimate Births throughout	30-84
BIRTHS Registered in the DIVISIONS and COUNTIES (distinguishing Males and Females) in each of the Four Quarters	86-89
BIRTHS of Children born out of Wedlock Registered in the DIVISIONS and COUNTIES (distinguishing Males and Females) in each of the Four Quarters	90-93
DEATHS Registered in DIVISIONS and COUNTIES (distinguishing Males and Females) in each of the Four Quarters	94-97
DEATHS of Males and Females in Public Institutions	99-118
DEATHS of Males and Females at different AGES Registered in DIVISIONS, COUNTIES, and DISTRICTS	120-141
CAUSES of DEATH of Males and Females in ENGLAND at different Periods of Life	144-149
SUPPLEMENTARY TABLE of CAUSES of DEATH of Males and Females in England at different Periods of Life	150-153
CAUSES of DEATH of Males and Females in LONDON at different Periods of Life	154-159
CAUSES of DEATH of Males and Females in ENGLAND, and in each of the DIVISIONS and COUNTIES	160-188
DEATHS from SEVERAL ZYMOTIC and OTHER CAUSES, and INQUEST CASES, in the DIVISIONS, COUNTIES, and DISTRICTS of ENGLAND	184-195
VIOLENT DEATHS in ENGLAND, distinguishing SEX and AGE	196-200
VIOLENT DEATHS in each of the ELEVEN DIVISIONS of ENGLAND, distinguishing SEX	201-205
DEATHS returned as having occurred from SUICIDE in ENGLAND, distinguishing SEX and AGE	206-207
DEATHS returned as having occurred from SUICIDE in each of the ELEVEN DIVISIONS of ENGLAND, distinguishing SEX	208-209
DEATHS returned as having occurred from MURDER and INFANTICIDE in ENGLAND, distinguishing SEX and AGE	210-211
DEATHS returned as having occurred from MURDER and INFANTICIDE in each of the ELEVEN DIVISIONS of ENGLAND, distinguishing SEX	212
DEATHS returned as having occurred from MANSLAUGHTER in ENGLAND, distinguishing SEX and AGE	213-214
DEATHS returned as having occurred from MANSLAUGHTER in each of the ELEVEN DIVISIONS of ENGLAND, distinguishing SEX	215

APPENDIX.

LETTER TO THE REGISTRAR-GENERAL ON THE CAUSES OF DEATH IN ENGLAND, BY WILLIAM FARR, Esq., M.D., F.R.S. :—

CAUSES OF DEATH :—

(1) <i>Zymotic Diseases</i>	219-220
(2) <i>Constitutional Diseases</i>	220
(3) <i>Local Diseases</i>	221
(4) <i>Developmental Diseases</i>	221-222
(5) <i>Violence</i>	222-223
TABLES	224-247

DEATHS from DIFFERENT CAUSES in ENGLAND in each of the Eight Years 1866-73, classified according to the Nomenclature adopted by the ROYAL COLLEGE OF PHYSICIANS 248-265

INDEX of DISTRICTS, SUB-DISTRICTS, and of certain TOWNS, referring to Numbers used in the several TABLES of ABSTRACTS 267-281

ALPHABETICAL INDEX to REPORT, TABLES, and APPENDIX 282-295

REPORT

TO

The Right Honourable GEORGE SCLATER-BOOTH, M.P.,
President of the Local Government Board, &c. &c.

*General Register Office, Somerset House,
11th August 1875.*

(1873.)

SIR,

I HAVE the honour to submit to you my Report on the Registration of Marriages, Births, and Deaths for the year 1873.

The statistics relating to the three great events of life—marriage, birth, and death—together with the causes which have regulated their numbers and proportions in different parts of the country have been briefly reviewed.

These results of civil registration show that the conditions of the year were favourable to the public health. Employment was abundant, and wages were good, and the people married in unusual proportions. The birth-rate was high, while the death-rate of the year, with only three exceptions, was the lowest on record.

Sanitary jurisdictions are now established all over the country and many hundreds of the medical profession acting as officers of health, are devoting their professional abilities to the advance of sanitary work, ascertaining the causes of sickness and death that are within their control, and adopting measures for the prevention of disease.

The Annual Reports of the medical officers of health for the large towns already bear witness to ability and success in the great work which they have undertaken, and I hope to see the results of their labours recorded in a still more satisfactory reduction of the death-rates of the country.

Increase of Population.—The excess of registered births over the registered deaths in the year 1873 was 337,258. The number of English emigrants returned by the Marine Department of the Board of Trade was 128,271, but the numbers who returned to these shores were not recorded; if they were—assuming civil registration to be nearly perfect, as it will be soon after the operation of the new registration Act in 1875—the means would exist for determining the actual increase of population in each year from the recorded facts. At present the population is estimated from the rate of increase observed in the thirty years 1840–71. By this estimate it amounted at the middle of 1873 to 23,356,414.

The powers and duties conferred and imposed on the Emigration Commissioners have, by the Merchant Shipping Act of 1872, been transferred from 1st January 1873 to the Board of Trade. According to the report prepared by the Marine Department, 310,612 emigrants left the ports of the United Kingdom in the year 1873, including 128,271 English, 22,041

Scotch, 85,670 Irish, and 74,630 Foreigners. 10,069 emigrants whose birthplaces were not distinguished, are proportionally distributed. The total loss by emigration exceeded that of 1872 by 15,399 persons. The proportional number of Irish emigrants is still much greater than that of English or Scotch. There was a decrease in the number of Foreigners compared with 1872 of 5926.

Of the 310,612 emigrants, 233,073 went to the United States, 37,208 to British North America, 26,428 to the Australian Colonies, and 13,903 to all other places.

Meteorology.—There is nothing very remarkable to record in the meteorological elements of the year 1873. The rain-fall was 23·4 inches, or 0·6 inches below the average. The 10th of December was remarkable for its low temperature all over the country. Three days of extreme low temperatures in London were distinguished by the presence of a dense fog. The mean temperature of the year at the Royal Observatory, Greenwich, was 48°·9, or ·5° below the average. The meteorology of the year is ably described by Mr. Glaisher, F.R.S., in his remarks on, pp. lxiii–lxiv. See also Tables, pp. xcvi–ci.

Prices.—During the last three months of 1873 there was a marked and extensive fall in the prices of coal and iron, and in a large class of commodities entering into manufactures.

The year 1873 may be said to have been a period of reaction from the high prices and excited demand of 1871, and more particularly from the high prices and wages of 1872.

The heavy rains in the autumn of 1872 were most disastrous to the cereal crops, and it was not until the latter part of January 1873 that farmers could make any appreciable progress in out-door operations. The fine harvest time in 1873 did not compensate for the bad seed time of autumn, and the late frosts of a dreary spring, so there was a deficiency in the yield of wheat. The year 1873 was remarkable for the increase in its wheat imports. The quantity imported for home consumption was 43,863,098 cwts., against 42,127,726 cwts. in 1872. In 1870 only 30,901,229 cwts. were imported; in 1871 the quantity was 39,389,803 cwts.

Butchers meat continued to advance in price, and beef by the carcase at the Metropolitan meat market ranged from 5½d. per lb. for inferior quality to 8½d. per lb. for superior quality. Mutton ranged from 6½d. per lb. for inferior quality to 9d. for superior quality.

It has been shown that during the twenty years ending 31st December 1873 wheat had risen 23 per cent. in price, beef 50 per cent., mutton 40 per cent., and potatoes 31 per cent., and confining the observations to more recent periods, the average prices in the three years 1868–70, and in the three years 1871–73 it is found that wheat had risen about 9 per cent., beef 13 per cent., mutton 20 per cent., and potatoes 7 per cent.

INCREASE per Cent. in the PRICES of WHEAT, BEEF, MUTTON, and POTATOES,
1868–70 and 1871–73.

PERIODS.	Wheat, per Quarter.	Beef, per Lb.	Mutton, per Lb.	Potatoes, per Ton.
	Shillings.	Pence.	Pence.	Shillings.
1868–70 - -	52·92	5·92	6·13	113·83
1871–73 - -	57·53	6·67	7·38	122·33
Increase per cent. -	8·71	12·67	20·39	7·47

That the rise in the price of commodities has been to some extent counterbalanced by a rise in the price of wages is a fact generally admitted; the labouring class have had it placed within their means to improve their condition in some respects, and there has been a general rise in the scale of living, still the fact remains that the rise in price in these important necessities of life—wheat, meat, and potatoes—has rendered the difficulty of living much greater than it was in former years.

Pauperism.—The annexed results of a census of paupers on the 31st December 1871-2-3,—excluding lunatics in asylums and vagrants,—from the report of the Local Government Board, show a still further decrease in the pauperism of the country.

		In-door.	Out-door.	Total.
1871	-	150,093	780,809	930,902
1872	-	147,657	690,979	838,636
1873	-	144,201	637,269	781,470

The decrease from 1872 to 1873 was 57,166 or 6·8 per cent., and from 1871 to 1873 it was 149,432 or 16·1 per cent.

The average number of paupers receiving relief on the last day of each week amounted to 137,775 in-door, and 656,843 out-door, against 137,278 in-door, and 714,970 out-door in the previous year.

MARRIAGES.

The deduction to be drawn from a review of the marriage returns for the year 1873 is one of general prosperity. Although provisions were dear, work was not scarce, and 205,615 weddings were celebrated, or 8696 more persons were married than in 1872, when the marriage-rate was high.

Years.	Persons married to 1000 persons living.
1869	15·9
1870	16·1
1871	16·7
1872	17·5
1873	17·6

The marriage-rate (persons married to 1000 population) in 1873 was 17·6, or ·8 above the mean of the last ten years.

The rate was highest in those counties where the greater proportion of the population is engaged in mining and commercial industry, viz., Northumberland 21·7, Stafford 20·8, Nottingham 20·5, Durham 20·4, Lancaster 20·2, East Riding of York 20·0, London 19·9, West Riding of York 19·6, Monmouth 19·3, South Wales 19·1, Leicester 18·8, Gloucester 18·6, Derby 18·4, Warwick 17·9. The rate was lowest in the agricultural counties, viz., Middlesex (extra-metropolitan) 10·6, Hereford 11·6, Hertford 12·2, Surrey (extra-metropolitan) 12·4, Essex 12·7, Salop 12·9, Westmorland 12·9, Wilts 13·1, Dorset 13·3, Rutland 13·5, Buckingham 13·9, Somerset 13·9.

In London, the South-eastern counties, the extra-metropolitan part of Middlesex, in Hertfordshire, Bedfordshire, Cambridgeshire, Wiltshire, Dorsetshire, Devonshire, Herefordshire, Shropshire, and Westmorland, the marriage-rate was below the mean of the ten previous years.

Forms of Marriage.—The marriages according to the rites of the Church of England twenty-five years ago were 123,182 or 87 per cent. of the total marriages. In 1873 they were 154,581 or 75 per cent. This decrease, as has been pointed out in previous reports, is chiefly accounted

for by the increasing number of marriages without religious ceremony at Superintendent Registrars' Offices. The number of marriages at these offices in 1849 was 5558 or 4 per cent. of the total marriages, whereas in 1873 it had increased to 21,178 or 10 per cent. The marriages not according to the rites of the establishment in 1849 were 18,701 or 13 per cent., in 1873 they had increased to 51,034 or 25 per cent.

Of 100 couples who married in 1873 according to the rites of the Established Church 50 married by special license, 11 by license, 85 after banns, and 3 by Superintendent Registrars' certificate, while in nearly 1 per cent. the clergy omitted to state under which of the foregoing heads the marriages should be classed. Of 100 weddings not according to the rites of the Church there were 16 in Roman Catholic chapels, 41 in registered places belonging to various Christian denominations, 2 among Quakers, 9 among Jews, and 41 at Superintendent Registrars' Offices.

First Marriages ; Re-marriages.—167,987 bachelors married spinsters during the year, 9559 bachelors married widows, 16,918 widowers married spinsters, and 11,151 widowers married widows ; so 48,779 persons married who had been previously wedded, against 47,359 in the previous year.

The registers at this office record the number of marriages of divorced persons in each year : the number registered in 1873 was 62, viz., 59 in which one or other of the contracting parties is stated to have been previously divorced, and 3 in which divorced men married divorced women. Of 33 divorced men who re-married, 26 married spinsters, 4 married widows, and 3 married divorced women. Of 32 divorced women who re-married, 20 were married to bachelors, 9 were married to widowers, and 3 were married to divorced men.*

The proportional number of divorced persons who re-married to every 10,000 persons married was 1.58 in 1873, the average for the ten previous years being 1.04.

Ages at Marriage.—The Census returns of 1871 relating to conjugal condition enabled me to show, in my last report, the annual rate of marriage at each year of age under 21, and to discuss the question as to the tendency to later or earlier marriage among the population of this country. The results relating to the marriage of minors in the different counties are instructive, bearing as they do on the social condition of the population ; they should be studied in connection with the occupations.

Of the 205,615 men who married in 1873 the ages of 150,131 were ascertained, and of that number 15,842 were of the ages 15 and under 21, but in addition to this number 1024 males married whose precise ages were not stated, but who were described in the registers as "minor" or "under age," so that the total number of males married under 21 years of age was 16,866. Of the 205,615 women who were married the ages of 150,131 were ascertained, and of this number 40,435 were of the ages 15 and under 21 ; 5762 were simply described as "minors" or "under age," the total number of females who married under 21 years of age was, therefore, 46,107. Thus of every 100 men married 8.2 were not of full age, and of every 100 women who were married 22.4 were not of full age. In the previous year the proportions per cent. were 8.0 and 22.3, respectively. The ratio has nearly doubled during the last thirty years.

The mean age at marriage of 150,131 persons whose ages at marriage were stated, in the year 1873, including the re-married, was 27.8 years

* The number of decrees of divorce pronounced by Her Majesty's Court for Divorce and Matrimonial Causes in the year 1873 was, nisi 272, absolute 215.

for men, and 25·6 years for women; these results are nearly the same as those of the previous year. The mean age at marriage of 131,347 bachelors was 25·6 years, against 25·7 in 1872, and the mean age at marriage of 135,970 spinsters was 24·2 against 24·6 in 1872.

The mean age at marriage, therefore, of bachelors and spinsters was rather lower than in the previous year and indicates an increasing tendency to early marriage, but the excess of births over deaths raises the proportion of persons living at the early ages, so that the mean age of marriage in an increasing population is rather understated.

Of 14,161 widows who re-married in 1873 and whose ages at marriage were stated, fifteen were under 20 years of age, viz., one aged 17 years, one aged 18 years, and thirteen aged 19 years.

As a general rule the proportional number of minors who marry is lowest in those counties where skilled labour is least in demand. Thus in the following counties, &c. the proportions per cent. among males were low. Hereford 1·9, Surrey (extra-metropolitan) 3·5, Rutland 3·8, Hants 4·2, Middlesex (extra-metropolitan) 4·3, Salop 4·3, North Wales 4·5, Westmorland 5·1, Kent (extra-metropolitan) 5·2, Berks 5·2, Dorset 5·3, Cumberland 5·5, Sussex 5·8, and Devon 5·8. The rate was highest among males, in Bedford 16·0, Leicester 13·8, Nottingham 13·4, Stafford 13·2, Derby 12·2, West Riding 11·5, Northampton 11·0, Lancaster 10·5, Warwick 10·1, Monmouth 10·1.

Among females the ratio was highest in the counties of Durham 33·4, Stafford 32·5, Derby 29·8, West Riding of York 29·4, East Riding (with York) 28·1, Monmouth 28·1, Leicester 27·9, Nottingham 27·4, and Northampton 25·2. The rate was lowest in North Wales 12·5, Salop 13·0, London 13·1, Hereford 13·6, Surrey (extra-metropolitan) 13·9, Cumberland 14·2.

Of the 205,615 marriages contracted in 1873, 167,987 or 81 per cent. were between bachelors and spinsters, 9559 or 4·6 per cent. were between bachelors and widows, 16,918 or 8·2 per cent. were between widowers and spinsters, and 11,151 or 5·4 per cent. were between widowers and widows, so 28,069 of the *men* who married, or 13·7 per cent., were widowers, and 20,710 of the *women* who married, or 10·2 per cent., were widows.

Signature in Marriage Registers.—The state of elementary education among the people as indicated by the proportion of men and women who signed their names in writing in 1873, shows a slight improvement compared with the results of the previous year, but a comparison of the proportions in 1873 with those in 1864 shows that education is in a much more advanced state now than it was 10 years ago. Of 100 men who married in 1873, 81·2 per cent. were able to write, and of 100 women who married the proportion was 74·6. In the previous year the proportional numbers were 80·6 and 73·7 respectively. In every 10,000 men, therefore, who married in 1873, 60 more, and of every 10,000 women 90 more, signed their names in writing than was the case in 1872.

In Monmouthshire only 64 *men* out of every 100 were able to write, in Staffordshire the proportion was 65, in Hertfordshire and Wales 71, and in Norfolk, Suffolk, and Shropshire 72.

But education has been most neglected among women, for in South Wales only 56 *women* out of every 100 were able to write, in Staffordshire the proportion was 58, Monmouthshire 61, North Wales 63, Lancashire 64, West Riding of York 66, Durham 67, Bedford 68.

The annexed results indicate the relative progress that has been made during the last ten years in some of the counties of England and Wales; the greatest improvement having taken place in those counties where there was most room for improvement.

Marriages.

INCREASE during the last Ten Years, 1864-73, in the NUMBER of PERSONS who SIGNED the MARRIAGE REGISTER in WRITING.

Counties, &c. showing the Greatest Improvement.

MALES.			FEMALES.		
		Per cent.			Per cent.
Rutland - - -	-	16·2	Huntingdonshire - - -	-	13·2
Bedfordshire - - -	-	11·3	Bedfordshire - - -	-	12·9
Essex - - -	-	10·4	Monmouthshire - - -	-	12·8
Huntingdonshire - - -	-	9·7	South Wales - - -	-	11·7
Dorsetshire - - -	-	9·1	North Wales - - -	-	11·5
South Wales - - -	-	8·6	Lancashire - - -	-	11·1
Berkshire - - -	-	8·1	Cornwall - - -	-	10·9
Hertfordshire - - -	-	8·1	Worcestershire - - -	-	10·3
Middlesex (<i>extra-Metropolitan</i>) - - -	-	8·1	Cambridgeshire - - -	-	10·1
Suffolk - - -	-	8·0	Westmorland - - -	-	9·9

Counties, &c. showing the Least Improvement.

MALES.			FEMALES.		
		Per cent.			Per cent.
Warwickshire - - -	-	1·7	Rutland - - -	-	2·9
Sussex - - -	-	2·5	Buckinghamshire - - -	-	2·9
London - - -	-	2·5	Warwickshire - - -	-	3·5
Westmorland - - -	-	2·8	Northumberland - - -	-	3·7
Durham - - -	-	2·8	London - - -	-	4·1
Leicestershire - - -	-	3·1	Herefordshire - - -	-	4·7
Staffordshire - - -	-	3·2	Durham - - -	-	5·0
Herefordshire - - -	-	3·4	Shropshire - - -	-	5·3
Northumberland - - -	-	3·6	North Riding - - -	-	5·4
West Riding - - -	-	3·8	Hampshire - - -	-	5·4

Thus out of every 100 men married in the county of Bedford, only 63·1 signed their names in writing in the marriage register in 1864, whereas in 1873 the proportional number was 74·4, so that 11·3 per cent. more men were able to sign in 1873 than was the case in 1864.

After making due allowance for differences of sex and age—for in some counties various inducements tend to raise the proportions of the living at ages 21 and under 30 above the normal average—it would be instructive to note the proportional amount of crime in those counties where elementary education has been comparatively neglected.

The effects of recent legislation in meeting the educational wants of the country will not be fully appreciated until the children of the present generation arrive at maturity. The average daily attendance in 1869 of children in schools receiving annual grants was 1,062,999. In 1873 it had risen to 1,482,480, but it is expected that under the operation of the Education Acts this average attendance will greatly increase. At the Census of 1871 it was ascertained that there were 5,374,301 children of the school ages, 3 and under 13; about one-seventh of these, it has been estimated, are children of a class above those who would attend public elementary schools, and assuming, in accordance with a statement in the Education Report, that the children only attend school for 7 years out of the 10, then there should be at least 3,224,580 under instructions in such schools, instead of 1,482,480.*

Buildings registered for Marriages.—The number of these buildings registered in 1873 was 232, bringing up the total number on the register at the end of the year to 7136. Of the 232 registered during the year 9 belonged to Presbyterians, 47 to Independents, 37 to Baptists, 1 to the United Brethren or Moravians, 9 to Roman Catholics, 2 to Unitarians, 100 to the various sects of Wesleyan Methodists, 21 to Calvinistic Methodists, 2 to the New Jerusalem Church, 1 to the Catholic and Apos-

* See Report of the Committee of Council on Education, 1874-5, pp. ix. and xiv.

tolie Church, and 3 to other places of worship. For the distribution of the 7136 buildings now on the register, under the various denominations, see Table 9.

Certified Places of Worship.—The number of places of meeting certified for religious worship during the year 1873 not being churches or chapels of the Established Church was 458. The number on the register on 31st December 1873 was 19,591. The following is a list of the various titles by which religious denominations have been certified to the Registrar General. The names printed in italics have been added since the publication of the list in the last Report.

BIRTHS.

829,778 births were registered in England and Wales during the year 1873. This is the highest number recorded, and exceeds that of the previous year by 3871. In proportion to population it was at the rate of 35·5 per 1000, nearly the same as that of 1872 (35·8) and about the same as the average of the ten previous years (35·3).

The absolute highest ratios of births to population were in the counties, &c. of Durham 45·8, Stafford 42·6, Northumberland 39·4, West Riding of York 38·9, Lancaster 38·9, Monmouth 38·5, Derby 37·6, Warwick 37·5, Leicester 37·4, and Nottingham 37·2. The absolute lowest were in those counties having a low proportion of married women at the child bearing ages, viz., Hereford 27·6, Dorset 28·9, Devon 29·8, North Wales 29·8, Sussex 29·9, and Westmorland 29·9.

Comparing the birth-rate in the different counties in 1873, with the mean rate of ten previous years, it is found that the rate was relatively high

in the counties of Monmouth, in Stafford, and Warwick, in four of the Midland and Eastern Counties, and in nine of the North Midland, North Western, and Northern Counties; in all the remaining counties the rate was low.

The birth-rate in England still slightly exceeds that of Scotland, while on the other hand, the death-rate is rather lower in England than in Scotland. The average annual rates in the five years 1869-73 were as follows:—

		ENGLAND.	SCOTLAND.
Births	- -	35·3	34·6
Deaths	- -	22·0	22·4

A high birth-rate raises the proportional number of children and adults living at ages at which the mortality is low, so a large excess of births over deaths instead of increasing the mortality has the effect of lowering it. Now that the Registration Act of 1874 is in operation by which the parents or other qualified informants are bound under penalties to give the registrars notice of every birth, a comparison of the results of civil registration in the two countries will be still more interesting.

Sex.—More boys than girls are *born* every year, the boys being in the proportion of 104 to every 100 girls. The Census returns of 1871 show that there are 95 males *resident in England* to every 100 females. Including the portion of the army, navy, and merchant seamen abroad belonging to England, the proportional number is 97. This disparity in the proportions of the sexes is attributable to a higher rate of mortality among males, and to an excess of emigration of males over females. The proportions vary in different years and in different counties.

Taking an average of ten years, the highest proportions of boys born were in Cornwall, North Wales, Northumberland, North Riding of York, Durham, Westmoreland, and South Wales.

Children born out of Wedlock.—The number of illegitimate births registered in 1873 was 43,161, representing a proportion of 5·2 per cent. of the total births registered. This is an improvement on the rate of the previous year, when it was 5·4 per cent.

It is noteworthy that the proportional number of registered children born out of wedlock has steadily decreased year by year since 1863, as will be seen by the annexed figures:—

Years.	Children born out of wedlock to every 100 births.			
1863	-	-	-	6·5
1864	-	-	-	6·4
1865	-	-	-	6·2
1866	-	-	-	6·0
1867	-	-	-	5·9
1868	-	-	-	5·9
1869	-	-	-	5·8
1870	-	-	-	5·6
1871	-	-	-	5·6
1872	-	-	-	5·4
1873	-	-	-	5·2

In the last 29 years the rate has decreased from 7·0 to 5·2 per 100 births, or about 26 per cent. The improvement observed in recent years in the *different counties* was discussed in my two last annual reports.

DEATHS.

Under the Public Health Act of 1848, the Local Government Act of 1858, and the Public Health Act of 1872, 933 *urban* sanitary districts have been established in the municipal boroughs and other towns of England and Wales, and in addition to these there are 590 *rural* sanitary districts under the authority of Boards of Guardians.

In conformity with the terms of the Public Health Act the local sanitary authorities have from time to time appointed medical officers of health* to preside over these 1523 districts, to watch over the health of the people residing within these areas, and to carry on the great work of sanitary reform.

In many of these urban districts there are traces of the good effects of the remedial work of some of these sanitary *præsidia*. Impure water supply has been stopped, overcrowding lessened, defective drainage remedied, and death-rates have consequently been reduced.

But just as the physician, besides being called upon to heal, has sometimes to administer a prophylactic to prevent others being infected, so it will be the duty of local sanitary authorities—acting upon the principle that prevention is better than cure—to appoint medical health officers before the populations have crowded into dense districts, and to watch over the formation of new towns: this is, in fact, the duty of the *rural* sanitary authorities.

When *remedial* measures attacking the existing agencies that are unfavourable to health, and other *preventive* measures are in operation all over the country, the effects will doubtless be made manifest in a more marked reduction of the death-rate of all England; but before all the practical good that is promised can be effected the medical officers of health will probably have to be armed with still greater legislative authority, so that none of their important recommendations may be neglected.

The deaths registered in England and Wales in 1873 were 492,520, a number differing but little from that registered in the previous year. The number in proportion to population was 21·1 per 1000, the mean of the ten previous years being 22·6, the rate of mortality in 1873 was, therefore, 1·5 per 1000 of population below the average, and indicates a more satisfactory state of the public health than that which existed in previous years.

The history of death-rates in the various towns and districts of England has been recorded in my annual reports for a period extending over 36 years, and from time to time it has been pointed out that the variations from such disturbing causes as sex and age are confined within comparatively narrow limits—especially the element of sex—and do not affect the general mortality of *persons at all ages* to such an extent as to interfere with its value as a sure indicator of the prevalence of conditions prejudicial to life; and recent investigations have confirmed this, and shown that the ratio of deaths to population *at all ages* may be taken as a fair indication of the sanitary condition of the population. Wherever the general mortality is high, agencies are to be found at work unfavourable to health, and the town or district requires the attention of the medical officer of health, but statisticians have long considered the general death-rate

* The total number of these officers is unknown, as in appointing medical officers of health the sanitary authorities are only required to report to the Local Government Board those *cases* where it is proposed to obtain repayment of a moiety of the salary of the officer from the Parliamentary grant. The number of *cases*, in which one or more medical officers have been appointed, thus reported up to 31st December 1874 was 727, viz., 360 appointed by rural authorities, 287 by urban authorities, and 80 by combined authorities. In addition to these is a large number of medical officers, unreported. The number of *cases* in which Inspectors of Nuisances have been thus reported was 752.

as only a preliminary test, to be followed up by further research relating to the mortality of children and adults at different ages, and by different diseases.

Sex and Age.—The deaths of 254,985 males and 237,535 females were registered in 1873 being in the proportion of 107 deaths of the former to 100 deaths of the latter. The rate of mortality per 1000 of population was 22·4 for males, and 19·8 for females. The rate varies considerably at the different ages. Among males under 5 years of age it was 66·5 per 1000 living at that age: at the age 5-10 the proportional number was 6·0, and at 10-15, when the mortality of *childhood* reaches its minimum, it was 3·7. After that age the rate increases at each period of age in the tables.

Among females the mortality under 5 years of age was 56·5 per 1000, at 5-10 it was 5·6, and at 10-15 it was 3·6.

The rate of mortality of children (males and females) at each of these three periods of age (0-5, 5-10, and 10-15) was 61·5, 5·8, and 3·6. Comparing these rates with those for the seventeen years 1838-54—on which the English Life Table is based, and which differ but little from the average rates of the twenty-five years 1848-72—the mortality in the year 1873, at these ages, is found to be comparatively low. To what extent the mortality is under or over the average at the different ages will be seen by the subjoined results.

Tables 26 and 27,* which show the rate of mortality at different ages in the Registration divisions and counties of England, will be studied with interest.

* See Preliminary Tables appended, pp. xci. and xcii.

The deaths of children under one year of age, chiefly from premature birth, debility, whooping-cough, convulsive diseases, and diarrhoea (the latter disease often being brought about through bad feeding), contribute largely to increase the general rate of mortality. Of the 492,520 deaths registered in England in 1873 no less than 123,768, or 25 per cent. were those of infants, and this high proportion is greatly exceeded in the large towns. It is gratifying, however, to know that the causes which lead to the regrettable high rate of mortality among children are now receiving full attention from the medical officers of health. Sanitary measures are arresting the ravages of diseases so destructive to childhood, and when the Artisans Dwellings Act comes into operation these officers will be enabled to condemn "unhealthy areas,"* but the unwholesome atmosphere in neighbourhoods that must almost of necessity remain comparatively densely populated, the want of sufficient space round the dwellings of the poor, the absence of proper maternal care in the large manufacturing districts, and other causes so prejudicial to the rearing of children over which the health officer has less control—all these still tend to keep up a high death-rate at the ages under 5, and he will be the greatest sanitary reformer of his age who can most successfully combat the unnatural surroundings which are so prejudicial to childhood in town populations.

Seasons.—In the first quarter of 1873 the health of the people was comparatively good, the annual rate of mortality for the three months being 23·0 per 1000 of population, or 1·9 below the average of 36 years. The mean temperature of the air, and the rain-fall deviated very little from the average. In the second quarter of the year when the mean temperature and the rain-fall were each about one degree below the average, the mortality was also low, being at the annual rate of 20·4, against an average-rate of 22·0. In the third quarter of the year the death-rate (19·5) was also below the average (20·6), the mean temperature and the rain-fall both being about the average. In the last quarter of the year the mortality was at the annual rate of 21·5, differing little from the average of 36 years. The rain-fall was 1·6 inches below the average, the mean temperature was about the average.

Detailed information respecting the meteorology in the four quarters of 1873 is contained in the "Summary of the Quarterly Reports" given in subsequent pages xxvi-lvi, and in Mr. Glashier's remarks on pages lxiii-lxiv.

Locality.—The death-rate of England and Wales in the year 1873 was 21·1 per 1000 of population; the rates differed in the various counties, but only in London, in eleven English counties, and in South Wales was this rate exceeded; in the remaining counties the mortality was below 21 per 1000, and it is noteworthy that the eleven counties showing these comparatively high rates contain the towns of Wolverhampton, Birmingham, Leicester, Derby, Liverpool, Manchester, Salford, Oldham, Bradford, Leeds, Sheffield, Hull, Sunderland, Newcastle-on-Tyne, Carlisle, and Newport.

A comparison of the mortality per 1000 of children under 5 years of age, in each of the 10 years 1841-50, and 1861-70, and in 1873, in these counties, &c. is subjoined.

* Dr. Seaton, the Medical Officer of Health for the borough of Nottingham in a recent report on the sanitary condition of the town states, that much has been done to improve the health of the old town, not only in the sewerage and paving of its filthy courts, but in the pulling down of houses which obstructed the admission of light and air; "that much, however, still remains to be done, may be judged of by the fact that there still exist as many as 8000 'back to back' houses, a great number of which are situated in narrow, unventilated courts, and alleys. All 'back to back' houses are, from a sanitary point of view, to be strongly condemned; their construction is such as to render the free circulation of air impossible."

Comparing the mortality in the two decennial periods an improvement is observed only in Warwick, Lancaster, East Riding of York, and Monmouth.

Although much has been done recently towards improving the sanitary condition of our large towns, the returns for the present year show that there are causes of sickness and death within our control yet to be grappled with. For the death-rates of these towns at all ages in 1873, see the reprint of my annual Summary for London and other large cities, and also the reprint of my Quarterly Returns herewith appended, pp. xxvi-lxii.

Measuring the mortality of infant life (0-1) in some of the large towns by the number of births, it appears that to every 1000 births registered in Bristol there were 157 deaths of infants, in London the proportional number was 159, in Norwich 159, Sunderland 163, Oldham 169, Nottingham 172, Hull 174, Wolverhampton 175, Birmingham 180, Sheffield 180, Salford 185, Newcastle-on-Tyne 186, Leeds 192, Manchester 198, Leicester 213, and Liverpool 213.

A certain amount of mortality over and above that ruling in rural districts—even under the best sanitary organization—will, it is to be feared, remain in the large towns, but by judicious arrangements the mortality among children under 5 years of age might be greatly reduced.

The rate of mortality in fourteen of the large English towns, among children under 5 years of age, in the year 1873, was lowest in Portsmouth 54·1, Norwich is second on the list 57·7, London is third 71·9, then follow Sunderland 74·6, Nottingham 81·8, Oldham 83·5, Liverpool 86·8, Birmingham 88·5, Leeds 90·7, Sheffield (1874) 91·7, Leicester 95·2, Newcastle-on-Tyne 98·7, Salford 98·9, and Manchester 100·5.

As regards Portsmouth the medical officer of health for this borough, in his report for the year 1873, directs attention to the fact that it has a lower general rate of mortality than the other large towns. This was supposed to be owing to the presence of a large number of soldiers and sailors, but in a subsequent report he gives the mortality exclusive of these classes and shows that this assumption was not correct. He states that he believes "the dockyard has a much more decided effect, and that "too in a way which is directly beneficial. A large manufactory giving "steady remunerative employment to 5500 of the better class of artisans, "who, while at work, are not weakened by over-crowding, want of proper "ventilation, and those mechanical conveniences which are frequently "essential to the health of the workmen employed, and which offers no "inducement to the mother to neglect her children during the hours

" of labour, must have a directly beneficial effect on a large portion of the community; probably in this instance, on at least one fifth of the whole town. In this, the surest of methods, it will reduce mortality. Another cause, I believe, is that the temperature is warmer and more equable than that observed in the other towns, even along the South Coast."

As has been pointed out in my previous reports some indication of any sanitary improvement in towns is afforded by the mortality at all ages from fever. Liverpool, Leeds, and Manchester are examples of the improvement that can be effected in this respect. The annexed results show to what extent the large towns have suffered from this disease in each of the four years 1870-73; they are arranged in the order of the mortality observed in 1873.

MORTALITY FROM FEVER IN LARGE TOWNS.

In the "Summary of the Quarterly Reports" subsequently given (pp. xxvi-lxii) will be found detailed remarks upon the sanitary condition of different localities as indicated by their death-rate in each quarter of 1873, together with such conclusions relative to the marriages and births as seemed to be deducible from the observed facts. And with regard to the large cities and towns of the United Kingdom, of which a selection of twenty-one has been made, with London at their head, I have nothing now to add to the comments in the Annual Summary of the Weekly Returns for 1873, hereto appended (pp. lvii-lxii).

Deaths in Public Institutions.—44,480 or 9 per cent. of the total deaths in the year 1873 occurred in 1300 of the principal public institutions in England and Wales. Of these 44,480 deaths, 29,016 or 65 per cent. occurred in 720 workhouses, 11,209 or 25 per cent. in 501 hospitals, and 4255 or 10 per cent. in 79 lunatic asylums. Only those deaths registered in workhouses, hospitals, and lunatic asylums are returned, inasmuch as the mortality of the respective sub-districts in which they are situated is disturbed principally by these three classes of institutions. Of the patients in hospitals the deaths of males are double those of females; probably the occupations of working men render them more liable to disease and injury than the occupations of women. In recent years additional accommodation has been afforded for the sick by means of cottage

hospitals, and to this cause the increase during the last five years in the total number of hospitals, from 241 in 1869, to 501 in 1873, is chiefly attributable. Including these cottage hospitals, where the accommodation for the sick is comparatively small, there was, in England and Wales, one hospital to every 46,620 of population, in London the proportion was one hospital to every 40,928 of population. In the South Eastern Counties the accommodation provided was one hospital for every 25,541 population. To each hospital in each of the other groups of counties the proportion of population was 49,278 in the South Midland, 53,775 in the Eastern, 34,390 in the South Western, 48,889 in the West Midland, 62,397 in the North Midland, 72,913 in the North Western, 69,196 in Yorkshire, 47,791 in the Northern Counties, and 51,854 in Wales.

As explained in an introductory note (p. 99) the Table of deaths registered in the principal public institutions situate within the several districts and sub-districts (pp. 100–118) will afford the means of correcting the death-rates, and so will be invaluable for purposes of local inquiry. Obviously, there is great disparity in the facilities the sick populations of different parts of the country have of access to institutions for the relief of their necessities.

A reprint of the table, published in my annual summary for 1873, showing the number of deaths registered in *all* the public institutions of *London* is appended to this report.* In the 53 weeks of that year 13,101 deaths were registered in 149 public institutions. Of every 1000 of these deaths, 565 occurred in fifty-six workhouses, 5 occurred in twelve prisons, 5 in two military asylums, 317 in thirty-four general hospitals, 45 in twenty-four hospitals for special diseases, 6 in five lying-in-hospitals, 16 in four naval and military hospitals, 10 in three hospitals for foreigners, and 31 in nine lunatic asylums.

PROGRESS OF REGISTRATION.

Names on the Registers, and Searches.—The names of all persons whose marriages, births, and deaths, have been recorded in the registers during the last 36½ years are, for the convenience of public reference, inscribed in alphabetical Indexes deposited at this office.

From the middle of the year 1837 to the end of the year 1865 the Indexes are in *manuscript*. For the years 1866–73, the Indexes are *printed*. 50,493,226 names—of which 1,733,528 were entered in 1873—are now indexed.

The annual number of searches at this office in the five years 1843–7—exclusive of searches in non-parochial registers, and of searches for purposes connected with the Factory Acts—averaged 778, whereas in the five years 1868–72, the average annual number was 15,057. In 1873 the number was 19,907. The amount of fees received and paid into Her Majesty's Exchequer for searches and certificates in the year 1873 was 3,142*l.* 9*s.* 6*d.*

For a complete list of all the public registers and records in my custody, I refer to my 34th Annual Report (pp. xxi–ii).

UNITED KINGDOM.

The population of the United Kingdom estimated by the respective Registrars General of England, Ireland, and Scotland, to the middle of the year 1873 was 32,124,598. The emigration statistics of Ireland show that 90,149 natives left that country during the year 1873, against 78,102 in the previous year. The estimated population of Ireland in 1873 was 5,337,261 or 34,938 less than in the previous year.

* See page c, Table 37.

The number of births registered in Ireland in 1873 was only 144,377 or 27·1 per 1000 of population, the number of deaths registered was 97,537 or 18·3 per 1000. The excess of births over deaths registered was 46,840. The number of marriages returned was only 25,730, the marriage-rate being 9·6 per 1000. The above numbers are considerably understated, and the Registrar General of Ireland in his last report again directs attention to the defective state of civil registration.

The estimated population of Scotland in 1873 was 3,430,923. The birth and death rates differ but little from those of England, but while the birth-rate of Scotland is nearly the same as that of England, the marriage-rate in the two countries differs considerably, as will be seen by the subjoined figures :—

Persons married to 1000 persons living.

Years.		England.	Scotland.
1864	-	17·3	14·4
1865	-	17·5	14·8
1866	-	17·5	14·6
1867	-	16·5	13·8
1868	-	16·1	13·2
1869	-	15·9	13·4
1870	-	16·1	14·2
1871	-	16·7	14·2
1872	-	17·5	15·0
1873	-	17·6	15·6

This is probably owing to the difference in the marriage laws of the two countries, for marriage in Scotland can be contracted without registration.

THE ARMY.

His Royal Highness the Field Marshal Commanding-in-Chief has favoured me with returns, for the year 1873, relating to the army. The average strength of the army at home and abroad was 188,379, and the number of deaths was 2139; the rate of mortality was therefore 11·4 per 1000 of mean strength, against 13·8 in 1872.

At home, the average strength was 100,583, the deaths were 931, and the rate of mortality per 1000 of mean strength was 9·6 among officers, and 9·2 among non-commissioned officers and men, against an annual average of 9·2 and 11·4 respectively in the twelve years 1861–72.

Abroad, the average strength was 87,796, the deaths were 1208, and the rate of mortality per 1000 of mean strength was 12·1 among officers, and 13·8 among non-commissioned officers and men, against an annual average of 14·0 and 19·3 respectively, in the twelve years 1861–72. So the mortality of the army, both at home and abroad, was below the average. A striking reduction in the mortality of non-commissioned officers and men at home is observed since the year 1868 when the rate fell from 12·3 per 1000, to 11·4 in 1870, and to 9·0 in 1872.

THE NAVY.

In the Statistical Report of the Health of the Navy for the year 1873, it is stated that the total force afloat was 45,440, and that the deaths were 378, so that the rate of mortality was 8·3 per 1000 or nearly the same as in the previous year.

xx The Navy.—Births and Deaths of British Subjects at Sea.

The number of deaths from disease was 274, and from wounds, injuries, and drowning 104. The death-rate from disease was 6·0 per 1000, and from violence 2·3 per 1000, against 5·7 and 2·5 respectively in 1872.

Out of the 274 deaths from disease 24 were referred to enteric fever, 32 to yellow fever, 16 to remittent fever, 39 to consumption, 20 to heart disease, 21 to pneumonia, 16 to dysentery, 10 to stomach disease, 8 to kidney disease, and 5 to delirium tremens. In every 100 deaths 27·5 were from wounds, injuries, or drowning.

The lowest ratio of sickness in 1873 was on the south-east coast of America; the highest in the irregular force.

The mean force employed on the *home* station was 22,400, and the deaths were 138, being in the proportion of 6·1 per 1000.

The annexed Table shows the mortality at the different Stations during the years 1872 and 1873:—

* Including the deaths by the loss of Her Majesty's ship Captain.

† Including the deaths by the loss of Her Majesty's ship Bombay.

BIRTHS AND DEATHS OF BRITISH SUBJECTS AT SEA.

Marine Register Book.—The number of returns forwarded to me by captains or commanding officers of British vessels relating to births and deaths occurring at sea among English subjects is incomplete. Particulars of only 80 of such births and 245 of such deaths were reported to me in 1873, whereas the number of births and deaths of British subjects at sea reported to the Registrar-General of Merchant Shipping and Seamen was 309 and 1201 respectively. These records will be more complete now that the Registration Act of 1874 is in operation, for by the 37th section of that Act every captain or master, or other person having charge of a ship and failing to forward the necessary particulars, is liable to a penalty not exceeding 5*l.* for each offence.

Mercantile Marine.—The number of mariners at sea, exclusive of masters, in the year 1873, as reported by the Registrar-General of Shipping and Seamen, was 202,239. The deaths were 5393, and the rate of mortality was therefore 26·6 per 1000 strength: this rate is considerably above the average (21·4) of 22 years.

The number of mariners in the merchant service, exclusive of masters, whose deaths were referred to drowning, together with the mortality by drowning in the Royal Navy in each of the years 1866-73, are shown in the annexed Table.

DEATHS by DROWNING in the Eight Years 1866-73.

* Including the deaths by the loss of Her Majesty's ships "Captain" and "Slaney."

The average annual mortality by drowning in the merchant service in the seven years 1866-72 was 13·3 per 1000 strength. Two thirds of the total deaths by drowning—5·4 per 1000—were called accidental, and this excessive mortality shows great carelessness of precautionary measures on the part of the owners, the masters, or the men. The average annual rate of mortality by wreck was 8 per 1000, but even this high rate was exceeded in the year 1873, when 2231 lives were lost by wreck alone out of a strength of 202,239, representing a mortality of 1·1 per 1000.

The total loss by drowning in 1873 was 3263 or 16·1 per 1000, and includes 1032, or 5·1 per 1000, by accident.

In the 8 years 1866-73, no less than 21,748 lives were lost by drowning, 13,244 by wreck and 8504 by accident.

It is gratifying to know that much of this deplorable sacrifice of human life is likely to cease when the "Merchant Shipping Act of 1875"* comes into operation. By this Act much time will be saved in bringing about the detention of unseaworthy ships, and the owners or masters will be compelled to use all reasonable efforts to insure the seaworthiness of their ships. If a ship is hereafter sent to sea in an unseaworthy state, or is not kept in a proper condition, the representatives of seamen will have a right of action for damages, and heavy penalties are also provided against sending ships to sea to the danger of human life.

The average annual rate of mortality by drowning in the seven years 1866-72 in the Royal Navy was 2·9 per 1000 strength, thus the risk of death by drowning in the Merchant Service is more than four times as great as it is in the Royal Navy.

* See Merchant Shipping Act, 1875, 38 & 39 Vict. c. 88. To continue in force until the first day of October 1876.

WILLS.

Mr. Leslie in his annual report of Judicial Statistics for 1873, publishes a return from the Chief Registrar of the Court of Probate, showing that the number of probates and administrations granted at the Principal Registry during the year was 16,010. The value of the effects was sworn under 70,576,080*l*.

The returns furnished by the district Registrars record the number of probates and letters of administration granted in the 40 district registries during the year as 25,249. The value of the property under which these probates and administrations were sworn was 48,811,011*l*.

The results for the Principal and District Registries combined were—probates and administrations 41,259—value of effects sworn under 119,387,091*l*. The average value of each being 2894*l*. against 2864*l*. in the previous year. The proportion of the cases in which people above the age of 21 left wills, or left estates on which letters of administration were taken was 1 in 6, or 16·0 per cent.

Printed Calendars of all grants of probates and administrations from the year 1858 to the present time, showing the names and descriptions of the testators and intestates alphabetically arranged, together with other particulars, are deposited for public reference at this office.

EUROPEAN STATES.

The details relating to vital statistics in Foreign States will be found in a series of tables on pages cxxiii–cxxviii. The annexed Table shows the annual rates per 1000 of population of persons married, births, and deaths in the various States from which returns have been received.

* The mean annual rates for Spain are for the ten years 1861–70, those for Italy are for the ten years 1863–72.

In comparing the average annual results in the 20 years 1853–72 with those for the year 1873, it must be borne in mind that deaths in war contributed to raise the mortality unduly in Austria in 1866, in Prussia in 1866, 1870, and 1871, and in France in 1870 and 1871. For explanation as to any remarkable increase in the respective rates from epidemics, see notes at foot of Tables, pp. cxxiv–cxxviii.

The marriage rate was highest in Prussia and Austria, and lowest in Sweden and Italy in the year 1873. The rates in Denmark, Sweden, Austria, the Netherlands, and Italy, were not only higher in 1873 than the average, but higher than the proportions in 1872. In France the marriage rate in 1873 (17·8), although higher than the average, was considerably lower than in 1872, when it was 19·5.

The highest birth-rates were in Austria (40·3) and Prussia (39·7), this is a natural sequel to the high marriage-rates in these two States, but the States with the *lowest* marriage-rates, which were Sweden and Italy, did not afford the lowest birth-rates, for the lowest birth-rate was in France (26·2). Sweden had a *comparatively* low birth-rate, while Italy had a high birth-rate. Probably all the marriages are not at present registered in Italy.

The death-rate in 1873 in each of the European States arranged in order of mortality was:—Sweden 17·2, Denmark 19·7, England 21·1, France 23·2, the Netherlands 24·0, Prussia 28·0, Italy 30·0, and Austria 38·5. In Austria the rate greatly exceeded the average (31·9), and in Prussia the mortality slightly exceeded the average (27·2). The mortality in 1873 in the other States was below the average.

INCREASE OR DECREASE OF POPULATION.

Population increases by the excess of births over deaths, and by the excess of immigration over emigration. On the other hand, the population may *decrease* by an excess of deaths over births, and of emigration over immigration.

Acquisition or loss of territory by some of the European States has interfered with the comparison of the annual rates of increase of population in recent years.

* Inclusive of the loss of the territories of Alsace-Lorraine the annual rate of decrease per cent. in the six years 1866-72 was 0.89.

NOTE.—The above rates have been deduced from the returns of population received from the different countries. In some cases the population is estimated to the middle of the census years, see detailed Tables, pages cxxiv-cxxviii. These results may therefore be found to differ slightly from the annual rates of increase per cent. published in the respective census returns of the different countries.

In the five years 1856-61 the annual rate of increase per cent. of population in France was 0.74. In the five years which succeeded (1861-66) the population increased at the rate of 0.36 per cent. After allowing for diminution of population by the loss of Alsace and Lorraine, the population in the six years 1866-72, owing to an excessively low birth-rate, and to a comparatively high death-rate among children,† decreased at the annual rate of 0.16 per cent. There are on an average but 319 children born in wedlock in France to every 100 marriages, whereas in England the proportional number is 406.

The enumerated population of Austria, including Hungary, Croatia, Slavonia, and Transylvania, but excluding the Italian States, was 32,618,002 in 1857, and 35,904,435 in 1869; the increase of population being at the annual rate of 0.80 per cent. Excluding Hungary, Croatia, Slavonia, and Transylvania, as well as the States of Italy, the enumerated population of Austria was 18,224,500 in 1857, and 20,395,083 in 1869; the increase of population being at the annual rate of 0.94 per cent. These populations include the army.

† The mortality of children under 5 years of age, in Paris, in the year 1873, was 10.6 per cent. of the numbers living at that age. In London in 1873, the mortality at that age was 7.2 per cent. In the five years 1856-60 the annual rate of mortality per cent. of children under 5 years of age in France was 7.9. In 1871 (the year of the siege) it was 10.1 per cent. of population, but in 1872 it fell to 6.8 per cent. In England the rate declined from 6.8 per cent. in the ten years 1851-60, to 6.2 in 1873. The ages of the 84,713 persons whose deaths were registered in the department of the Seine in 1870 (the first year of the war) are not given in the Official Returns of France.

In Prussia the population increased in the three years 1858-61 at the rate of 1·39 per cent. ; in the five years 1861-67 the increase was at the annual rate of 1·11 per cent. ; and in the four years 1867-71 it was 0·69 per cent.

The population of Denmark increased in the five years 1850-55 at the rate of 1·28 per cent. per annum ; in the next five years 1855-60 it increased at the rate of 1·41, and in the ten years 1860-70 the annual rate of increase, decreased, and was only 1·05 per cent.

In Sweden, for the same periods as for Denmark, the annual rates of increase per cent. were 0·89, 1·17, and 0·77 respectively.

The Netherlands show an increase of population between the Censuses of 1859-69 of 0·80 per cent. per annum.

In Italy the annual rate per cent. of increase of population between the Censuses of 1861 and 1871 was 1·82.

No enumerations of the population have been taken in Spain since those of 1857 and 1860 when the annual rate of increase per cent. was 0·45.

I have the honour to be,

Sir,

Your faithful servant,

GEORGE GRAHAM,

Registrar-General.

QUARTERLY REPORTS, 1873.*

First Quarter.—January, February, March.

In the UNITED KINGDOM the marriages of 116,156 persons, the births of 284,779 children, and the deaths of 184,674 persons of both sexes, were registered in the three months ending 31st March 1873. The natural increase of population was thus 100,105.

ENGLAND.—The Returns of marriages, births, and deaths are almost all equally favourable. The marriage-rate has completely recovered from the depression of the year 1869; the births of the first ninety days of 1873 greatly exceeded, while the deaths were below the average. The people were unusually healthy, especially in the towns. The subsidence of epidemics, the abundant rain-fall, and the absence of nights of excessively low temperature, contributed, with the increased attention to hygienic measures, to this result; as, through rises of wages, their influence was not overwhelmed, though it was counteracted, by the high prices of the necessaries of life. Meat, bread, potatoes were dear, but their cost bore no proportion to the rise in the cost of coal, which was at a famine price, though the deaths by cold weather were less numerous than might have been expected.

Marriages.—The number of persons married during the first quarter of the year 1873 was 82,434, giving a rate per 1000 persons living of 14·3, or 0·5 above the average rate for the corresponding quarter of the ten years 1863–72, and higher than in the March quarter of any year since 1866. Of the eleven Registration Divisions the South-western alone exhibited a decrease from its average number of marriages for the three previous corresponding quarters. In the Northern Division the numbers exceeded the average by nearly one fifth. The counties showing the greatest excess were Huntingdonshire, Buckinghamshire, Staffordshire, Cumberland, Bedfordshire, and Durham. In thirteen counties the marriages fell short of their average numbers, the deficiency being relatively greatest in Oxfordshire, Dorsetshire, Devonshire, and Monmouthshire. In the last-mentioned county during several previous quarters the marriages had largely exceeded the average.

Births.—In the first quarter of 1873, 215,744 births were registered, giving an annual birth-rate of 37·5 per 1000, or 1·2 higher than the rate in the previous corresponding quarter, and 0·5 above the mean rate for the March quarter in the ten years 1863–72. The most remarkable increase was shown in the county of Durham, where the births exceeded the average of the three previous corresponding quarters by nearly 20 per cent. Large additions have probably been made to the population of this county during the last year through immigration consequent upon the demand for labour in the coal mines and iron works. The excess over the average was also considerable in the East Riding of Yorkshire, Cumberland, Northumberland, the Extra-Metropolitan part of Middlesex, Buckinghamshire, and Cambridgeshire, but in none of these counties was the percentage of increase equal to half that in Durham. The births fell below the average of the three previous corresponding quarters generally throughout the South-eastern and South-western Divisions, and also in the counties of Hereford, Westmorland, Norfolk, Rutland, Leicester, Lincoln, and in North Wales. In the eighteen large towns furnishing weekly

* Reprinted from the "Quarterly Returns" of 1873.

returns the birth-rates averaged 40·0 per 1000. They ranged from 35·2 in Norwich and 35·6 in Nottingham, to 45·8 in Salford and 49·4 in Sunderland. In London the rate was 38·4. In the fifty towns ranking next in population after the eighteen largest the average birth-rate was 38·8. The lowest rates were 26·0 in Bath, 28·7 in Hastings, and 29·6 in Brighton; and the highest 49·0 in Dudley, 49·4 in Wigan, and 49·6 in Gateshead.

Increase of Population.—The excess of births over deaths amounted during the 90 days of the quarter to 83,312 or 926 per day. The number of emigrants of British origin, who sailed from ports in the United Kingdom at which Government Emigration officers are stationed, was 29,486, of whom 17,269 were of English, 2162 of Scotch, and 10,055 of Irish origin. In the previous corresponding quarter the number of British emigrants was 25,660, comprising 15,060 English, 1942 Scotch, and 8658 Irish. The proportions of English, Scotch, and Irish emigrants last quarter to the respective populations of England, Scotland, and Ireland were as follow: English 739, Scotch 630, and Irish 1881 per million persons. Of the 29,486 emigrants the United States attracted 23,131, British North America 293, the Australian Colonies 4396; the remaining 1666 went to other places.

Prices, Pauperism, and the Weather.—The average price of wheat for the three months ending 31st March was 55s. 10d. per quarter, differing by only 6d. from the average price for the March quarter of 1872, when it was 55s. 4d. During the two years (1871–2) of high prices no great fluctuations have occurred in the quarterly average prices of wheat, the highest average having been 59s. 9d. in the June quarter of 1871, and the lowest 55s. 4d., as above stated, in the March quarter of 1872. Potatoes (best Regents) reached the high average price of 20s. per ton at the Borough and Spitalfields Markets, against 100s. in the quarter ending 31st March 1872, and 87s. 6d. in the quarter ending 31st March 1871. The price of beef by the carcass at the Metropolitan Meat Market averaged 6½d. per lb., the same as in the previous quarter, and that of mutton 7½d., showing a rise of ¾d. per lb.

The returns of pauperism, when compared with those for the previous corresponding quarter, show a slight increase in the average number of in-door paupers, and a further considerable decline in the average number of out-door paupers relieved on the last day of each week. The proportion of each class of paupers in the first quarter of each of the three years 1871–73 to 1000 of the estimated population was as follows:—

		In-door.	Out-door.
Quarter ending 31st March	1871	- 7·1	38·6
"	1872	- 6·4	33·7
"	1873	- 6·4	30·1

The warm period which set in on the 9th of last December continued till January 19th. From the 1st to the 19th January the mean daily excess of temperature was 10°. After a few days of average temperature a cold period began on 25th January and continued throughout February, during which the average daily deficiency was 4°. This was followed by a week of warm weather with an average daily excess of 3½°, then by a cold fortnight during which the average daily deficiency was 3¼°, and the quarter closed with a week of warm weather in which the daily excess averaged 3½°. The mean temperature for the quarter was 39°·4 or 0°·8 above the average in 102 years. It was 42°·1 for January, 34°·3 for February, and 41°·9 for March. Thus the mean temperatures of January and March were nearly equal, and were respectively 7°·8 and 7°·6 above that of February. The mean temperature of January was 5°·8 above and that of February 4°·3 below the average in 102 years. The mean temperature of March differed but little from the average. A decline of

several degrees in temperature from January to February is rare. Except in 1853, the decline this year was greater than any that has occurred during a period of more than 100 years. The rain-fall in the quarter at Greenwich amounted to 5·7 inches, or 0·2 in. above the average of 58 years. There was an excess of 0·6 in. in January and of 0·3 in. in February, and a deficiency of 0·4 in. in March. The mean quantity collected during the quarter between latitudes 50° and 55° was 8·08 inches.

Deaths; and State of the Public Health.—The 132,432 deaths registered during the first three months of this year were less than the number returned in the corresponding period of any year since 1868. The mortality was at the annual rate of 23·0 per 1000 persons estimated to be living against 26·0, 24·7, and 23·5, respectively, in the first quarters of the three years 1870–1–2; the rate in the quarter was 2·2 per 1000 below the average rate in the corresponding quarter of the ten years 1863–72. The mean temperature of the quarter was 39°·4, which, although somewhat higher than the average for the same period in 102 years, was no less than 4°·1 below the unusually high mean temperature which prevailed during the first three months of 1872. January was remarkably mild, but the temperature during February was unusually low, although there was no continuance of severe frost. The influence of this cold weather upon the mortality may be judged by the death-rate recorded in the 18 large English towns, including London, which are estimated to contain a population of nearly six millions and a half of persons, and for which a weekly return is published. During the five weeks ending 1st February, when the mean temperature at the Royal Observatory, Greenwich, averaged 42°·0, or 5°·0 above the average, the annual death-rate in these 18 towns averaged 21·9 per 1000, while in the last eight weeks of the quarter, when the mean temperature was 38°·1, or 2°·1 below the average, the death-rate was 26·6 per 1000. It is probable that the death-rate in the whole of England and Wales was influenced by the cold weather of February scarcely less than in the 18 towns. The decline in the mortality of the quarter cannot be attributed to its higher temperature, but was rather due to the marked decline in the fatality of the principal zymotic diseases which will presently be considered.

In the eleven Registration Divisions the mortality ranged upwards from 18·8 in the South-eastern Division, which contains the principally rural counties of Surrey, Kent, Sussex, Hampshire, and Berkshire; in the Yorkshire, and Welsh Divisions the rate was 23·8, and in the North-western Division, including the counties of Lancashire and Cheshire, it was so high as 26·9. In Lancashire the annual death-rate was equal to 27·7 per 1000, while in Cheshire it did not exceed 22·9; the excess in the Lancashire death-rate was in great measure due to the fatality from zymotic diseases, and to the high rate of infant mortality.

The Registration Districts and sub-districts, containing all the chief towns of England and Wales, have an estimated population of nearly 13 millions and a half of persons; among this urban population the annual death-rate was 24·4 per 1000, and 3 per 1000 below the average rate in the ten previous corresponding quarters. In the remaining, or rural population, the death-rate was 21·1 per 1000, and only 1·5 below the average rate in the first quarter of the ten years 1863–72. The urban mortality was one per 1000 below that in the March quarter of 1872, while the rural rate showed a slight increase. The marked improvement in the public health, which is doubtless in progress, appears to be principally confined to the town districts, in which the fatality of zymotic diseases is decreasing. The formation of rural sanitary districts will probably enable the small villages and country parishes to exhibit before long a decline in their death-rate corresponding with the improvement in the health of the towns.

In the 18 large English towns, including London, with a population of six millions and a half, for which weekly returns are published, the average mortality was 24·8 per 1000, or but slightly above the rate in the entire urban population; the lowest rates in these towns were 18·1 in Portsmouth, 22·1 in Nottingham, and 22·7 in London; the highest rates were 29·4 in Newcastle-upon-Tyne, 30·8 in Oldham, 31·1 in Salford, and 34·1 in Manchester. The excessive rates in Newcastle and Oldham were caused by the fatality of scarlet fever, while measles and scarlet fever were prevalent in Manchester and Salford. Let us hope that the excellent sanitary intentions of these great centres of manufacturing industry will soon be realized. Every day's delay is dangerous.

Fifty other large towns are estimated to contain a population of rather more than two millions and a half, among whom the death-rate in the first quarter of the year was equal to 24·7 per 1000, which differed but slightly from the rate in the 18 largest towns, and was 0·3 per 1000 above the rate in the entire urban population. Of the 50 towns, Dover 17·6, Yarmouth 19·3, Brighton 19·5, Lincoln 19·5, and Maidstone 19·5, showed rates under 20 per 1000; while the rates exceeding 30 per 1000 were 31·5 in Exeter, 33·5 in Bury, and 35·5 in Preston. The rate from zymotic diseases was excessive in each of these three last-mentioned towns.

The 132,432 deaths in England and Wales included 30,903, or 23 per cent. of infants under one year of age; and 38,305, or 29 per cent. of persons aged 60 years and upwards. The deaths of infants under one were lower than in any of the three previous corresponding quarters, notwithstanding the large increase in the number of births since the first quarter of 1870. The deaths of infants under one were equal to 15·8 per cent. of the births registered in the first quarter of 1870, to 14·9 in the same periods of 1871 and 1872, and in the three months ending March 1873, the proportion further fell to 14 per cent. Infant mortality measured in this way averaged 14·2 in the 18 large English towns, and ranged from 10·9 in Portsmouth to 18·9 in Leicester, which town maintains its unenviable notoriety for waste of infant life; so excessive is this infant mortality in Leicester, that it seems to demand a special inquiry into its cause. In the whole county of Lancashire the deaths of infants under one year were equal to 16·7 per cent. of the births registered, which appears to suggest some intimate connection between the employment of women in factories and infant mortality. In the agricultural counties of Hereford, Wilts, and Devon, this per-centage of deaths under one year to births registered was only 9·5, 12·0, and 12·1 respectively. The deaths of persons aged 60 years and upwards showed generally last quarter a large increase upon the numbers returned in the corresponding quarters of 1871 and 1872; a result probably caused by the cold weather of February following a January of remarkably high temperature. The annual death-rate in the quarter among persons estimated to be living in England and Wales, and aged 60 years and upwards, was equal to 89 per 1000, against 92, 85, and 76 respectively, in the first quarters of the three years 1870-1-2. The proportion of deaths at 60 years and upwards to total deaths was 29 per cent. in all England, while in the 18 large English towns it was 24·6, and ranged from 16·8 and 17·3 in Oldham and Manchester, to 33·0 and 33·5 per cent. respectively in Nottingham and Norwich.

One of the most remarkable and satisfactory features in the present return is the decline in the fatality of the principal zymotic diseases. In England and Wales, of the 132,432 deaths from all causes, 1084 were referred to small-pox, 1204 to measles, 2644 to scarlet fever, 579 to diphtheria, 2935 to whooping-cough, 3402 to different forms of fever, and 1854 to diarrhoea: in all, 13,702 deaths resulted from these seven zymotic diseases against 20,091, 21,551, and 24,794 in the corresponding quarters of the three years 1870-1-2. The annual death-rate from these seven

diseases was equal to 2·4 per 1000, against 3·6, 3·8, and 4·3 in the three previous corresponding quarters. The recent small-pox epidemic somewhat impairs the value of these rates as a means for measuring the recent decline in the fatality from zymotic diseases; but excluding small-pox, the annual rate from the six other principal zymotic diseases in the first quarter of the four years 1870-3 has been successively 3·5, 3·0, 3·0, and 2·2 per 1000.

In the 18 large English towns the annual death-rate from the seven zymotic diseases averaged 2·6 per 1000, exceeding by 0·2 the rate in the whole of England and Wales; this zymotic rate was lowest 0·5, 1·8, and 1·9 in Nottingham, Bristol, and London, and ranged upwards to 5·4, 5·5, and 5·8 respectively in Salford, Manchester, and Newcastle-upon-Tyne. In 50 other large towns the death-rate from the seven zymotic diseases averaged 2·7 per 1000, and was slightly higher than in the 18 towns; it was less than 1 per 1000 in Ipswich, Cambridge, Reading, Yarmouth, and Dover, but exceeded 5 per 1000 in Exeter, Carlisle, Bury, and Wigan.

The 1084 fatal cases of small-pox returned in the first three months of this year showed a further considerable decline from the numbers returned in any quarter since September 1870, when the recent epidemic first became prevalent. The deaths from this disease showed a further decline in each of the Registration Divisions, but still numbered 282 in the West Midland Counties, 197 in Yorkshire, 117 in the Northern Counties, and 116 in the South-western Counties; 154 fatal cases were returned in Staffordshire, 143 in the West Riding of Yorkshire, 87 in Cornwall, 66 in Lancashire, 56 in Worcestershire, 50 in the East Riding of Yorkshire, 48 in Durham, and 45 in Cumberland. The disease is still more or less fatally prevalent at Oldbury, Newcastle-under-Lyme, Truro, Helston, Halesowen (Worcestershire), York, Huddersfield, Darlington, Hartlepool, Cockermouth, and Whitehaven. The deaths from small-pox in England only averaged 4·50 in the first three quarters of 1870; they were, therefore, more than twice as numerous during the quarter as before the outbreak of the recent epidemic; it is only necessary, however, to state that 7720 deaths from this disease were returned in the first quarter of 1872 (when the epidemic reached its climax) to show the extent of the decline in this fatality exhibited in the present return.

Fever, including typhus, enteric, or typhoid fever, and all forms of simple continued fever, caused more deaths during the quarter than any other form of zymotic disease. The 3402 deaths referred to fever were, however, considerably less than the numbers returned (among smaller populations) in the corresponding quarters of the three years 1870-1-2, when they were 4177, 4073, and 3544 respectively. These deaths were equal to an annual rate of 59 per 100,000 of the population, against 75, 73, and 62, in the three preceding corresponding quarters. In the 18 largest English towns the equivalent fever rate averaged 56, and ranged from 18 and 40 the lowest in Nottingham and London, to 87 and 145 in Bradford and Sheffield. As the fever rate was slightly lower among the six and half millions of persons living in our 18 largest towns than in the whole country, and as the fatality from fever is usually the result of over-crowding or impure air or water, it is fair to assume that so soon as the smaller towns and villages shall have the advantage of sanitary organization like that now enjoyed by most of the largest towns, the death-rate from fever and other zymotic diseases will decline. Fever was prevalent throughout the greater part of Staffordshire, especially at Longton, and in many parts of Durham county. Local outbreaks of fever appear to have also occurred in Calstock, Sherborne, Doncaster, Hetton-le-Hole (Durham), Newport (Monmouth), Pontypridd, and Ystradgunlais.

Whooping-cough is usually most fatal in the first quarter of the year; the 2935 deaths referred thereto were less by 1764 than those returned in

the same period of 1872. No less than 693 occurred in London, 405 in Lancashire, and 259 in the West Riding of Yorkshire. The disease was exceptionally fatal in St. Columb and Falmouth, and caused 72 deaths in the borough of Birmingham.

Scarlet fever was fatally epidemic during 1870, but the mortality from this disease has since steadily declined. In the first quarter of the three years 1870-1-2 the deaths from scarlet fever were 6693, 6086, and 3385, respectively; they further declined during the quarter to 2644, of which 676 occurred in Lancashire, 250 in Staffordshire, 234 in the West Riding of Yorkshire, 186 in Northumberland, and 144 in Warwickshire. Among the 18 large towns this disease was more or less fatal in Manchester, Newcastle, Oldham, and Birmingham; and outbreaks of the disease occurred in Oswestry, Darlaston, Wednesbury, Sleaford, Wirksworth (Derby), Glossop, Bollington (Cheshire), Runcorn, Bury, Poulton-le-Fylde, Blyth (Northumberland), Tregaron, and Ruabon.

The decline in the fatality of measles was almost as marked as that of the other diseases of the zymotic class. The fatal cases were but 1204, against 1922, 1476, and 3121, in the three previous corresponding quarters; 401 occurred in Lancashire, 83 in North Wales, 78 in Durham, and 61 in Leicestershire. The fatality of measles was excessive in Olney (Bucks), Glastonbury, Loughborough, Salford, Manchester, Carlisle, Festiniog, and Bangor.

The deaths referred to diphtheria differed but slightly from those in the first quarter of 1872 while those returned from diarrhoea somewhat exceeded the numbers in recent corresponding quarters. The deaths from diphtheria were proportionally numerous in Wadhurst (Sussex), Bedale (Yorkshire), and in Merthyr-Tydfil.

In the principal English public institutions, including workhouses, hospitals, and lunatic asylums, 12,863 or 9·7 per cent. of the total deaths were recorded; the proportion of these deaths in the corresponding quarter of the three years 1870-1-2 was 8·7, 9·7, and 8·9 respectively. In the 18 large towns last quarter this proportion averaged 15·3 per cent., and ranged from 7·4 in Oldham, to 17·2 and 18·4 in Wolverhampton and London. The inquest cases registered in England and Wales during the three months under notice were 7057 or 5·3 per cent. of all the deaths, against 4·7, 5·0, and 4·6 per cent. in the three previous corresponding quarters; in the 18 large towns the per-centage in the quarter averaged 7·2, and was lowest, 3·6, in Bradford, while the highest proportions were 8·5 in Manchester and 11·1 in Birmingham. These per-centages of inquest cases in our large towns suggest the idea that too few Coroner's inquiries as to causes of death are held in Bradford, unless too many are held in Birmingham. The 2195 English Registrars report that 4124 or 3·1 per cent. of the deaths from all causes resulted from different forms of violence; in the corresponding quarters of 1871 and 1872 the deaths from violence were only 3883 and 3885. In the 18 large towns the proportion of deaths from violence averaged 3·8 per cent., and while it was so low as 1·8 in Bradford, was 5·7 and 5·8 per cent. respectively in Liverpool and Birmingham.

LONDON.—The health of the population living within the Metropolitan registration area, estimated at about three and a quarter millions of persons at all ages, was remarkably satisfactory during the first three months of the year, if judged either by the death-rate from all causes, or by the fatality from the principal zymotic diseases. The annual rate of mortality did not exceed 22·7 per 1000 persons living, while in the three previous corresponding quarters it was 26·7, 26·9, and 24·0 respectively. When it is considered that this large population is living within an area of 75,362 acres, with an average density of 43 persons to an acre, the fact that the London death-rate in the quarter was lower

than the average rate for the whole of England and Wales, is important evidence of the benefit derived from the sanitary organisation under which London lives; few will doubt, moreover, that even this sanitary system is susceptible of much improvement and increased efficacy. The seven principal diseases of the zymotic class caused 1566 deaths in the quarter, which were no less than 2164 below the average number in the corresponding quarter of the ten years 1863-72, after correction for increase of population. The annual death-rate from these seven diseases in the thirteen weeks ending 29th March was only 1·9 per 1000, whereas it averaged 2·6 in the eighteen large towns, and was 2·4 in the whole of England and Wales. Whooping-cough was the only zymotic disease which was especially fatal; the deaths from scarlet fever and measles were remarkably few, and the fatal cases of small-pox were fewer than in any previous corresponding quarter since 1862. The deaths referred to different forms of fever were but 337, against 458 and 402 in the two previous corresponding quarters; the annual death-rate from fever, in the whole country was equal to 59 per 100,000 persons living, while within the Metropolitan area this fever rate was but 40. Diseases of the respiratory organs and phthisis caused 7306 deaths in London, which were 477 below the corrected average number in the corresponding period of the previous ten years; these deaths showed an annual rate of 8·7 per 1000 persons living. The unusually low temperature of February caused a large increase in the rates of mortality from all causes, but especially from diseases of the respiratory organs. The annual death-rate at all ages from these diseases during the five weeks ending 1st February was only 6·3 per 1000, while, influenced by the cold weather in February, it rose to 10·6 in the next five weeks ending 8th March. The cold weather affected the mortality from these diseases, at the different groups of ages, to a very different extent. Among children under five years of age the annual rate per 1000 rose from 12·1 in the five weeks ending 1st February, to 18·3 in the succeeding five weeks, under the influence of the February cold; among children and adults aged between 5 and 40 years, the rate only increased from 3·1 to 3·8; while between 40 and 60 it rose from 8·0 to 13·9, and at 60 years and upwards from 22·5 to 53·5 per 1000.

The detailed information in the weekly returns as to the causes of death and the ages at death in London, gives the means of studying the influence of temperature upon the mortality from various forms of disease, not only at all ages, but at each of several groups of ages. It would be important to be able to compare these London results with those for other large towns, and for some of the recently formed Rural Sanitary Districts. The limits of this Return, even if the facts were at hand, would render it impossible here to discuss these results; it may, however, be hoped that the form of returns adopted by the numerous medical officers recently appointed for both Urban and Rural Sanitary Districts will be sufficiently uniform in character to afford the means for this and other important comparisons of results. Invaluable light might thus be thrown upon the causes of the variation in death-rates, which can at present be little more than guessed at.

HEALTH OF FOREIGN CITIES.—The following facts relating to Indian and Foreign cities are derived from official returns furnished by various authorities abroad:

In Paris the deaths during the quarter numbered 11,088, and were at the annual rate of 24·4 per 1000. In Brussels the births were 1581, and the deaths 1218; the respective rates were 34·4 and 26·5. The returns from Berlin comprise 5745 deaths, including 231 from typhus fever; the death-rate from all causes was 29·9, and that from typhus fever 1·1. In Vienna 5335 deaths were recorded, implying an annual rate of 34·4 per

1000; 735 deaths, equivalent to an annual rate of 4·8, were caused by small-pox. The returns from Rome show 720 persons married, 2029 births, and 1963 deaths, the respective rates being 12·0, 33·3, and 32·2. In Florence the persons married were 768, equal to a rate of 15·9; the births 1817, equal to a rate of 37·2; and the deaths 1552, equal to a rate of 31·6. In Turin there were 958 persons married, 1635 births, and 1615 deaths; the marriage-rate was 18·2, the birth-rate 30·9, and the death-rate 30·4; 152 deaths, equal to an annual rate of 2·9, were caused by measles.

In Calcutta the deaths during the quarter ending 15th March were 3643, of which 1363 were caused by fevers and 551 by cholera. In Bombay 4448 deaths were returned in the quarter, and the annual death-rate was 27·6 per 1000; of these 4448 deaths 1500, equal to an annual rate of 9·3, were referred to remittent fever, and 389 to small-pox. In Madras during the quarter ending 14th March 3702 deaths were recorded, showing a death-rate of 37·6; 240 deaths were referred to small-pox.

In New York 7074 deaths were reported in the quarter, giving a death-rate of 30·1. The returns from Philadelphia showed 4118 deaths, and a death-rate of 22·1 per 1000.

Second Quarter.—April, May, June.

In the UNITED KINGDOM the marriages of 130,254 persons, the births of 277,364 children, and the deaths of 164,625 persons of both sexes, were registered in the three months ending 30th June 1873. The natural increase of population was thus 112,739.

ENGLAND.—The people have been prosperous, and as is usual under these circumstances, the marriages exceeded the average in the first quarter of the year. The birth-rate exceeded in the winter, and was below the average in the spring quarter. The winter and the spring were healthy. The high prices of the necessities of life, the effects of the depreciation of gold and paper, have been met by rises in the wages of the working classes. Small-pox declined and all other zymotic diseases were at a low ebb. Fever was, of all these diseases, the most fatal.

Marriages.—In the quarter ending 30th June 1873, the number of persons married was 105,816, or at the rate of 18·3 per 1000 living. This rate was 0·8 above that in the June quarter of the previous year, and equalled the rate in the corresponding quarter of 1866; in none other of the ten years 1863–72 did the marriage-rate in the second quarter of the year exceed 17·5. A comparison of the number of marriages registered in the quarter ending 30th June with the average number in the three previous corresponding quarters, in each Registration Division and County, gives the following results. There was an increase in each Registration Division, the greatest proportionally being in the Northern and North Midland Divisions, and the least in the South-western, South-eastern, and Eastern. In the counties, the greatest increase is observed in Nottinghamshire, Durham, Staffordshire, Leicestershire, and Derbyshire; a very slight increase is seen in Suffolk, Dorsetshire, and Somersetshire; and a decrease in Wiltshire, Devonshire, Herefordshire, Shropshire, Rutland, and Westmorland. Viewing the rise or fall of the marriage-rate as a sufficiently reliable indication of the bright or gloomy prospects of the mass of the population, it may be inferred from the returns for this and several previous quarters that the prosperity which, on the whole, this country has enjoyed during the last two years has not been diffused amongst all sections of the community; but that, speaking generally, it has been experienced principally in the coal and iron-mining districts, to a less degree amongst the population engaged in the cotton and woollen manufactures, and very little, if at all, in the purely agricultural parts.

Births.—In the second quarter of 1873 ending 30th June, 206,516 births were registered, fewer by 2195 than in the second quarter of 1872. The birth-rate, 35·5 per 1000, was 0·8 below the mean rate for the ten previous June quarters, and as much lower than the rate for the corresponding quarter of 1872. In the South-eastern, South Midland, Eastern, and South-western Registration Divisions the births were below the average numbers registered in them respectively for the three previous corresponding quarters. Twenty counties showed a decline from their respective averages, the greatest falling off being in Huntingdonshire, Herefordshire, Suffolk, and Berkshire. In most of the remaining counties the increase was only slight; it was most considerable in Northumberland and Durham. In the eighteen largest English towns, including London, the birth-rates averaged 36·6 per 1000, against 37·7 in the previous corresponding quarter. In London the rate was 33·9, or 1·4 less than in the June quarter of 1872. The lowest rate last quarter in these eighteen towns was 32·4 in Norwich, and the highest 43·9 in Sunderland. In the fifty next largest towns the average birth-rate was 36·6, the same as in the eighteen towns. The variation of the rates in these fifty towns was from 23·2 in Hastings, 24·4 in Bath, and 25·4 in Chatham, to 47·5 in Gateshead, 49·0 in Dudley, and 50·0 in Wigan. The population of these last three towns may possibly have increased more rapidly than has been estimated, in which case the birth-rates would be lower than above stated.

Increase of Population.—The births during the three months exceeded the deaths by 87,934; the natural increase of population was thus at the rate of 966 per day. The emigrants of British origin, who sailed during the quarter from ports at which Government Emigration officers are stationed, numbered 103,382, of whom 45,202 were English, 10,858 Scotch, and 47,322 Irish. The numbers in the previous corresponding quarter were, English 40,423, Scotch 9168, and Irish 39,622. The proportions of English, Scotch, and Irish emigrants last quarter to a million of the respective populations of the three countries were, English 1935, Scotch 3164, Irish 8854. Of the 103,382 British emigrants 80,835 had for their destination the United States, 16,169 British North America, 5209 the Australian Colonies, and the remaining 1169 various other places.

Prices, Pauperism, and the Weather.—The average price of wheat for the three months ending 30th June was 56s. 5d. per quarter against 55s. 10d. in the previous quarter ending 31st March, and 56s. 8d. in the quarter ending 30th June 1872. The mean price for the June quarter in the ten years 1863–72 was 51s. 6d. Potatoes (best Regents) averaged 212s. 6d. per ton at the Borough and Spitalfields Markets, or 75s. 6d. more than in the corresponding three months of 1872, and nearly double the mean price (107s. 6d.) for the quarter ending 30th June in the ten years 1863–72. A further large advance took place in the price of meat, the average price of beef by the carcase at the Metropolitan Meat Market having reached 7½d., and of mutton 8½d. per lb. In the previous quarter the respective averages were 6½d. and 7½d., and the mean prices for the same period of the previous ten years were 5½d. per lb. for beef, and 6½d. for mutton. The average price per ton of seaborne coal in the London Market was 20s. 3d. against 21s. 7d. and 16s. 2d. in the corresponding quarters of 1872 and 1871 respectively.

The average number of in-door paupers relieved on the last day of each week in the quarter slightly exceeded the number in the corresponding quarter of 1872, but there was a considerable decrease in the number of out-door paupers. The proportion of each class of paupers in the second quarter of each of the three years 1871–73 to 1000 of the estimated population was as follows:—

			In-door.	Out-door.
Quarter ending 30th June	1871	-	6·2	35·4
"	1872	-	5·8	31·4
"	1873	-	5·8	28·5

The first five days of April were warm, with a mean daily excess of temperature of $3\frac{1}{4}^{\circ}$; then followed a cold week with an equal deficiency. From the 14th to the 21st April the weather was again warm, the average daily excess of temperature being $6^{\circ}\cdot 9$. On the 22d April a long cold period set in, and continued till the 18th June, the deficiency of temperature averaging $2\frac{3}{4}^{\circ}$ daily. The remainder of the quarter was warmer, but not uninterruptedly so, the temperature on four of the twelve days having been below the average for the season. The mean temperature for the quarter was $51\cdot 8$ or $0\cdot 5$ below the average in 102 years. The deficiency for April was $0\cdot 1$, and for May $2\cdot 0$; for June there was an excess of $0\cdot 7$. The rain-fall at Greenwich, differing but slightly from the mean quantity collected between latitudes 50° and 55° , amounted to $4\cdot 7$ inches, or one inch less than the average in 58 years. In April and May there was a deficiency, and an excess in June.

Deaths; and State of the Public Health.—The 118,582 deaths registered during the second or spring quarter of this year were 2337 below the average number returned in the corresponding period of the three years 1870–2, without any correction for increase of population, and the number was actually lower than in the second quarter of any year since 1868, when only 110,010 deaths were registered. The mortality was at the annual rate of $20\cdot 4$ per 1000 persons estimated to be living, against $21\cdot 6$, $21\cdot 3$, and $21\cdot 0$ respectively in the spring quarters of the three years 1870–1–2; the average rate in the corresponding quarter of the ten years 1863–72 was $21\cdot 8$, while in the several years of that period the rates ranged from $24\cdot 2$ in 1866 to $20\cdot 2$ in 1868. The unfavourable effect upon the public health, produced by the prolonged continuance of the usual dry cold winds incidental to an English spring, appears to have somewhat counteracted that of the unusually small fatality of the principal zymotic diseases.

In the eleven Registration Divisions the mortality of the quarter was so low as $16\cdot 4$ and $17\cdot 5$ per 1000 in the South-eastern and South Midland Divisions, which contain principally rural counties; in the other divisions the rates ranged upwards to $22\cdot 9$ in the northern counties (including the mining districts of Durham and Northumberland) and $24\cdot 1$ in the north-western counties of Lancashire and Cheshire. Compared with the average number of deaths returned in the second quarters of the last three years, the deaths registered in the quarter showed a considerable increase in Norfolk, Derbyshire, Cheshire, Lancashire, Cumberland, and North Wales; this increase occurred in spite of a considerable decline both in the whole of England and Wales and in most of the other counties, and may generally be traced to the excessive fatality of zymotic disease.

The Registration Districts and sub-districts containing all the chief towns of England and Wales have at the present time a population estimated at nearly 13 millions and a half of persons; among this urban population the annual death-rate was $21\cdot 6$ per 1000, and $1\cdot 8$ per 1000 below the average urban rate in the ten previous corresponding quarters; the nearest approach to so low an urban rate in any of those ten spring quarters was $22\cdot 0$ in 1867, while it ranged upwards to $26\cdot 4$ in 1866. In the remaining or rural population the death-rate in the quarter was $18\cdot 8$ per 1000, and $0\cdot 9$ below the average rate in the second quarters of the ten years 1863–72; only once during those ten years was the rural death-rate during the spring quarter lower than in this quarter, in 1868 it was but $17\cdot 4$. Town death-rates naturally show a larger decline, as the result of sanitary progress, than do those in rural districts; in the first place the excess in town death-rates afforded a more fruitful field for the operation of sanitary reform, and secondly, the importance of matters relating to the public health has been more slowly appreciated in agricultural than in urban neighbourhoods. The formation of rural sanitary districts is, however, now making rapid progress, and

the appointment of competent health officers to such districts would doubtless soon result in a decline in the rural death-rates more nearly corresponding with the improvement in the health of towns, which has recently been conspicuous.

In eighteen of the largest English towns, including London, for which weekly returns are published, having an estimated aggregate population of about six millions and a half, the annual mortality in the quarter averaged 22·0 per 1000, and exceeded but slightly the rate in the whole of the urban population, 21·6. The lowest rates in these eighteen towns were 16·9 in Portsmouth, 19·5 in Norwich, and 20·0 in London; the highest rates were 26·5 in Oldham, 27·0 in Newcastle-upon-Tyne, 29·0 in Manchester, and 30·4, in Salford. The average rate in these large towns differed but slightly from that which prevailed in the same period of last year; the decline in the death-rates in Portsmouth and Leicester was considerable, while in Manchester, Salford, and Newcastle the death-rates were decidedly higher. The rate from the principal zymotic diseases in Manchester and Salford was nearly double that which prevailed in the aggregate of the eighteen towns; the fatality of these diseases also showed a marked excess in Newcastle and Wolverhampton, while it was unusually low in Norwich, Nottingham, Portsmouth, and Sunderland. Both measles and scarlet fever were epidemic in Manchester, measles in Salford, and scarlet fever in Newcastle and Wolverhampton.

In fifty other large towns, estimated now to contain a population of rather more than two millions and a half, the death-rate was equal to 21·7, almost identical with the general urban rate, and 0·3 per 1000 lower than that in the eighteen larger towns. The following of these fifty towns showed rates below 17 per 1000:—Colchester 14·6, Dover 15·2, and Cardiff 16·6; the two first mentioned of these three towns enjoyed an almost complete immunity from zymotic fatality. Exeter, Wigan, Bury, Blackburn, Gateshead, and Carlisle had death-rates between 25 and 30 per 1000, while in Macclesfield the rate was so high as 30·3, in Preston 30·9, and in Ashton-under-Lyne 32·8. The excess in the death-rate of most of these towns was due to an exceptional fatality of zymotic diseases.

The 118,582 deaths in England and Wales included 27,256, or 23 per cent., of infants under one year of age, and 31,115, or 26 per cent. of persons aged 60 years and upwards. The deaths of infants under one year were equal to 13 per cent. of the births registered during the quarter, this proportion being almost identical with that which prevailed in the three preceding corresponding quarters. Infant mortality, measured in this way, averaged 14·4 in the eighteen largest towns, and ranged from 11·1 and 11·4 in Portsmouth and Norwich, to 18·2 and 19·9 respectively in Liverpool and Oldham. The excessive infant mortality in Leicester, which has been continually noticed in these reports, showed a decline during the quarter. In the manufacturing county of Lancashire the proportion of deaths under one year to births registered was 15·5 per cent. in the quarter; in Durham, containing principally a mining population, it was 15·1 per cent., while in the South-western Registration Division, which includes the agricultural counties of Wiltshire, Dorsetshire, Devonshire, Cornwall, and Somersetshire, the per-centage of infant mortality to births was only 11·0, and was so low as 9·5 in Wiltshire. One of the most noticeable features in the death returns for the quarter now under consideration was the high death-rate among persons aged 60 years and upwards, probably due to the influence of the cold winds during the spring, through an excessive fatality of bronchitis and other inflammatory diseases of the respiratory organs. According to the proportion observed in the numbers enumerated in 1871, there were living in England and Wales at the middle of this year 1,745,569 persons aged 60 years and upwards; among these elderly persons the annual rate of mortality during the quarter was equal to 72

per 1000, whereas during the spring quarter of the three years 1870-1-2 the rate among persons at these ages did not exceed 68·6, 65·7, and 65·2 per 1000 respectively. The proportion of deaths of persons aged 60 years and upwards to total deaths was 26 per cent. in the quarter in England and Wales, against 23·1 and 23·6 per cent. in the two previous corresponding quarters; in the eighteen large towns it averaged only 20·9 per cent., and ranged from 15·5 and 16·1 per cent. in Salford and Bradford, to 23·7 per cent. in Nottingham and Liverpool, and to no less than 40·2 per cent. in Norwich. In explanation of the remarkably high percentage in Norwich it is important to bear in mind that the proportions of persons living at the several groups of ages are found at each Census enumeration to differ widely in the various towns. For instance, the proportions of persons living in 1871 aged 60 years and upwards averaged 5·8 per cent. of the total population in the eighteen large English towns, and ranged from 4·7 per cent. in Sheffield, and 4·8 in Liverpool, to 7·4 and 9·7 per cent. respectively in Nottingham and Norwich. This large proportion of persons living at these ages in the last two mentioned towns would in great measure account for the large proportion which the deaths of elderly persons bear to the total deaths. If, however, the annual death-rate among persons estimated (from the proportions showed at the last Census) to be living at ages 60 years and upwards be calculated for one or two of these towns, results are produced which deserve further investigation. It has before been stated that in England and Wales the death-rate in the quarter among persons at these ages was equal to 72 per 1000, and it is found to have been but 67·2 in the South-western Division, composed principally of agricultural counties. This annual death-rate among elderly persons was 80·3 per 1000 in Norwich, 81·0 in Bradford, 94·7 in Manchester and Salford, and 120·0 in Liverpool. It is scarcely surprising to find that in Liverpool, where the death-rate until quite recently was so excessive, elderly persons are delicate and die at an excessive rate. In the eighteen large English towns the annual death-rate last quarter among persons aged 60 years and upwards averaged 78·3 per 1000, and was 62·9 in Portsmouth. It appears from an examination of the causes of death in London that the high death-rate among elderly persons was there caused by the excessive fatality of diseases of the respiratory organs, and especially of bronchitis.

The present return again shows a satisfactory decline in the fatality of the principal zymotic diseases. In England and Wales, of the 118,582 deaths from all causes; 722 were referred to small-pox, 1524 to measles, 2088 to scarlet fever, 460 to diphtheria, 2575 to whooping-cough, 2883 to fever, and 2018 to diarrhoea; in all, 12,270 deaths resulted from these seven principal zymotic diseases, against 18,120, 21,420, and 19,636 in the corresponding quarters of the three years 1870-1-2. The annual death-rate from these seven diseases, which had been equal to 3·2, 3·8, and 3·4 in the spring quarters of the three years 1870-1-2, declined to 2·1 per 1000; this decline is in some measure due to the disappearance of the small-pox epidemic which prevailed in 1871-2, but the general decline in the fatality of the other zymotic diseases, renders it possible to attribute the decrease in the deaths from this class of diseases to an improved and improving sanitary condition of the people.

In the eighteen large English towns, including London, the annual death-rates from these seven zymotic diseases averaged 2·6 per 1000, and ranged from 1·1 in Norwich to 5·6 in Salford. In the fifty other towns ranking next in size as regards population, this zymotic rate was 2·3 per 1000, and while it was less than one per 1000 in Dover, Brighton, Cambridge, Colchester, and Bath, ranged upwards in the other towns to 6·0 and 6·1 per 1000 in Walsall and Gateshead. In the whole of England and Wales exclusive of the sixty-eight large towns, the zymotic death-rate was equal to 1·8 per 1000.

More deaths in England and Wales in the quarter were referred to different forms of fever than to any other zymotic disease ; they were 2883, against 3524, 3269, and 2745 in the three preceding corresponding quarters. The annual death-rate from fever, which in the second quarters of the three years 1870-1-2 had been equal to 63, 58, and 48 per 100,000, slightly increased to 50. In the eighteen largest English towns the equivalent fever rate in the three months exactly corresponded with that in the whole of England and Wales, and ranged in the several towns from 36 per 100,000 in London and 39 in Leicester and Sunderland, to 99 and 126 respectively in Sheffield and Bradford. That the average rate from fever in our eighteen largest towns should not exceed that for the whole country, is satisfactory evidence of the improved sanitary condition of the six and a half millions of persons composing the population of those crowded town centres. A few years ago the fever rate in Liverpool was very high ; last quarter it was but 53 per 100,000, and only slightly exceeded the average rate in the whole country. In many smaller towns and villages the fatality of fever still shows the necessity for conferring, as rapidly as may be, upon the whole nation the advantages of sanitary organization similar to that now enjoyed by many of the large towns. The death-rate from fever and other zymotic diseases, will then continue to decline still more rapidly. The fatal cases of different forms of fever showed an excess last quarter at Tottenham, Longton (Staffordshire), Kingswinford (Worcestershire), North Bierley (Yorkshire), Yarm (Durham), Blaenavon and Aberystwith (Monmouthshire), and at Aberdare and Ystradgunlais in Glamorganshire.

Whooping-cough was as usual less fatal in the second than it had been in the first quarter of the year ; the 2575 fatal cases reported in the quarter were also less by 840 than had been returned in the same period of 1872. The disease, however, was somewhat fatally prevalent in London, caused 18 out of 50 deaths in Littleport sub-district of Ely, and prevailed to some extent in Essex.

The fatality of scarlet fever continues to decline ; in the second quarters of the three years 1870-1-2 the deaths from this disease were 5973, 4210, and 2206 respectively, and further declined to 2088. Among the large towns scarlet fever was somewhat fatally prevalent in Newcastle, Manchester, Birmingham, and Wolverhampton ; local outbreaks of the disease also occurred at Diss (Norfolk), Walsall, Glossop, Horwich (near Bolton), Harwood (near Blackburn), Fleetwood, Handsworth (near Sheffield), Ruabon, and in several villages in Cardiganshire. The deaths from diphtheria were also below the average, and the fatality of this disease calls for no special remarks.

The 1524 deaths referred to measles, although exceeding by 320 those returned in the preceding three months, were 834 below the average number in the three preceding corresponding quarters. More than half the fatal cases of measles in the quarter occurred in the eighteen large English towns, including 302 in London and 244 in Manchester and Salford. The fatality of the disease was also excessive at the Royal Victoria Hospital, South Stoneham ; East Budleigh (Devonshire), Lichfield, Carlisle, and Festiniog.

The waves of the recent small-pox epidemic continue to recede, and the 722 deaths from this disease were fewer than in any preceding quarter since the three months ending September 1870, when the number was 500 ; the epidemic may be said to have broken out in the last quarter of that year. The 722 deaths from small-pox in the quarter included 105 in the West Riding of Yorkshire, 82 in Staffordshire, 67 in Durham, 57 in Cumberland, 49 in Lancashire, and 46 in Warwickshire. The disease was prevalent at Kenwyn (Cornwall), West Bromwich, Tipton, Great Grimsby, Morley (near Leeds), Darlington, Hartlepool, Durham, in the Egremont sub-district of Whitehaven, and Aberdare.

In the English workhouses, hospitals, and lunatic asylums 11,244, or 9·5 per cent. of the total deaths in the quarter, were recorded. In the eighteen large towns the proportion averaged 14·9 per cent., and ranged from 6·6 and 7·1 per cent. in Oldham and Bradford, to 16·3 and 18·3 per cent. respectively in Liverpool and London. The inquest cases registered in the three months were 6246, and equal to 5·3 per cent. of all the deaths; the proportion of inquests held was slightly in excess of that in recent corresponding quarters. In the large towns the inquest cases were equal to 6·9 per cent. of the deaths, the proportion in the several towns ranging upwards from 2·7 in Bradford, to 8·0 in London and Manchester, and 9·2 in Birmingham. If it be necessary and desirable to hold inquests in Birmingham upon more than 9 per cent. of the deaths which occur, it appears open to doubt whether a sufficient number of these inquiries be held in Bradford. The 2195 English registrars report that to different forms of violence 3895, or 3·3 per cent. of the deaths in the quarter, were referred; in the eighteen large towns the proportion of deaths from violence averaged 3·8 per cent., and ranged from 1·6 in Oldham and 1·9 both in Bristol and Bradford, to 5·1 and 5·3 respectively in Birmingham and Liverpool.

HEALTH OF ENGLISH WATERING PLACES.—As in former corresponding seasons a special Table is published in the present Quarterly Return, which affords the means of ascertaining approximately the state of health recently prevailing in 47 seaside or inland watering places to which a considerable proportion of town residents resort at this time of the year for healthy relaxation. The population of the districts and sub-districts taken to represent these 47 watering places is estimated at rather more than a million persons, among whom the annual death-rate in the quarter averaged 18·0 per 1000, or 17·7 in the sea-side towns and 18·6 in the inland places. The figures show that the health of these towns was in the aggregate eminently satisfactory. Corrections have been very generally made for deaths in public institutions, which would otherwise have materially affected the value of the calculated death-rates for the purposes of comparison. It must be borne in mind that the registration sub-district is the smallest unit from which returns of births and deaths are forthcoming; in many instances therefore the smaller watering places are necessarily represented by entire sub-districts, which often contain a considerable rural area. The result of this, however, would in most instances be favourable to the watering place, as regards the rate of mortality obtained. The lowest rates appearing in the Table prevailed in Hove, Bognor, Exmouth, Lyme Regis, Ramsgate, and Dartmouth, in each of which the rate of mortality was under 14 per 1000; rates exceeding 24 per 1000 prevailed, however, in Poulton-le-Fylde sub-district (including Blackpool and Fleetwood), Southport, Aberystwith, Matlock, and Bangor. The annual death-rate in the quarter from the seven principal zymotic diseases averaged only 1·2 per 1000 in the 47 watering places, but exceeded 3 per 1000 in Herne Bay, Bangor, Fleetwood, and Matlock. Measles prevailed in Bangor, and scarlet fever in Fleetwood and Matlock.

LONDON.—The population residing within the London registration area is estimated to the middle of this year, at rather more than three and a quarter million of persons. The health of this large population, massed upon an area of 75,362 acres, with an average density of 43 persons to an acre, was very satisfactory during the first quarter of 1873; indeed, the death-rate was lower during those three months than the rate which prevailed in the whole of England and Wales. During the second quarter of this year the London death-rate was equal to 20·0 per 1000, against 23·1 and 20·7 in the corresponding period of 1871 and 1872; this death-rate was again slightly lower than the general English rate. The deaths

referred to the seven principal diseases of the zymotic class, were 1832, and were no less than 1909 below the average number in the corresponding quarter of the ten years 1863-72, after correction for increase of population. The annual death-rate from these seven diseases was equal to 2.2 per 1000 during the 13 weeks ending 28th June, whereas it averaged 2.6 per 1000 in 18 of the largest English towns, and was 2.1 in the whole of England and Wales. Whooping-cough was by far the most fatal disease in this class, the 807 deaths referred thereto showing an increase of 114 upon the number returned in the first quarter of the year; they were, however, 46 below the corrected average number referred to this disease in the corresponding quarter of the ten years 1863-72. The fatal cases of different forms of fever, which in the second quarters of the four years 1869-72 had been 542, 442, 384, and 304, further declined to 298 last quarter, which was rather less than half the corrected average number in the ten previous corresponding quarters. This decline in the fatality of fever may be referred to an improved sanitary organization, to a partially purified river, and to the greater purity of the water supplied by the metropolitan water companies. The deaths from fever in London last quarter were equal to an annual rate of 36 per 100,000 of the population, while in the other large towns it ranged upwards to 99 in Sheffield and 126 in Bradford. Only 37 deaths resulted from small-pox, while the corrected average number in the ten previous corresponding quarters was 662; the deaths from measles were 302 against an average of 563, and those from scarlet fever and diphtheria only 182 against an average of 694.

The annual death-rates from all causes in the several groups of registration districts, after distributing the 3048 deaths in institutions in proportion to population, were 19.5 in the West, 19.1 in the North, 20.5 in the Central, 20.4 in the East, and 20.4 in the South districts.

The excessive mortality among elderly persons, apparently due to the long period of low temperature and cold winds which prevailed with but trifling exceptions from 22d April to 18th June, is noticeable in London as well as in the whole country. The deaths of persons aged 60 years and upwards in London last quarter were 3711 against 3357 and 3388 in the two preceding corresponding quarters. Among those persons estimated to be living at the ages 60 and upwards the annual rate of mortality was 71.4 per 1000, and almost identical with the average rate in the whole of England; London may be considered generally favourable to the health of elderly persons, compared with other large towns, for the death-rate among persons aged 60 years and upwards was 81 in Bradford, 95 in Manchester and Salford, and 120 in Liverpool.

The deaths referred to diseases of the respiratory organs and phthisis in London, which in the second quarters of the three years 1870-1-2 had been equal to 6.5, 5.9, and 6.3 per 1000, respectively, gave a death-rate of 6.7 per 1000 in the three months ending June. The largest increase appears to have occurred in the fatal cases of bronchitis, which were 2015, against 1470 and 1674 in the two preceding corresponding quarters. A comparison between the death-rates from this class of diseases in different seasons and in various localities is very desirable, and it is hoped that the form of returns adopted by the numerous medical officers of health, now being appointed for both urban and rural sanitary districts, will afford the means for such comparison.

HEALTH OF FOREIGN CITIES.—The following facts relating to Indian and Foreign cities are derived from official returns furnished by various authorities abroad:

In Paris the deaths during the quarter were 10,555, and at the rate of 23 per 1000 annually. In Brussels 1573 births and 1144 deaths (excluding those of strangers, *i.e.* of persons not ordinarily residing within the

city) were recorded, showing rates of 34 and 25 respectively. The deaths in Berlin numbered 6699 and the annual death-rate was 33; the fatal cases of typhus fever, which had been 231 in the previous quarter, declined to 183. In Vienna 4804 persons, exclusive of strangers, died during the quarter, and the corresponding death-rate was 30; 354 deaths were referred to diarrhoea. In Rome 830 persons were married, 1533 children were born, and 1724 persons (excluding strangers) died; the respective rates were 14, 25, and 28. The returns from Florence are incomplete. Those from Turin show the number of persons married to have been 968, of births 1553, and of deaths 1524, giving rates of 18, 29, and 29 respectively. In Amsterdam 1725 deaths in the quarter gave an annual death-rate of 25 per 1000; and 640 deaths in the Hague were equal to a rate of 28.

In the thirteen weeks ending 24th June, 3906 deaths were registered in Bombay, of which 1239 were referred to remittent fever, and 349 to small-pox; the death-rate from all causes was equal to 24 per 1000. In Calcutta 2606 deaths were returned in the thirteen weeks ending 14th June, and the rate was 23. In Madras 3684 deaths, including 498 from small-pox, were recorded during the quarter ending 13th June; the death-rate from all causes was 37.

In New York 6593 deaths were registered during the quarter, of which 274 were from scarlet fever and 186 from diphtheria; the annual death-rate from all causes was 26. According to the returns from Philadelphia 3932 deaths occurred in that city, implying a death-rate of 21 per 1000.

Third Quarter.—July, August, September.

In the UNITED KINGDOM the marriages of 121,084 persons, the births of 266,655 children, and the deaths of 150,944 persons of both sexes, were registered in the three months ending 30th September 1873. The natural increase of population was thus 115,711.

ENGLAND.—The summer has been healthy: the mortality low in town and country; small-pox fatal to very few children; measles, scarlet fever, diphtheria, and whooping-cough quiescent; fever less prevalent than in previous years. Diarrhoea, while cholera was looming round our shores, wherever there was dirt, asserted its destructive prerogative, but less than in previous hot seasons of the year. The birth-rate was above the average; the natural increase of population rapid. If prices were high, so were wages.

In the quarter ending 30th September last, 99,418 persons were married, against 99,612 in the quarter ending 30th September 1872. The marriage-rate was 16·9 per 1000, showing a decline of 0·2 from that in the corresponding season of the prosperous year 1872, though it still contrasted favourably with the rates which prevailed in the previous period of depression. The numbers in the different Registration Divisions and Counties are usually compared in these Reports with the averages taken from the numbers registered in each of them during the three previous corresponding quarters. On this comparison, Leicestershire, Oxfordshire, Durham, South Wales, the extra-metropolitan portion of Middlesex, Lincolnshire, and the North Riding of Yorkshire show the greatest proportionate increase, while the only counties in which any noticeable decrease appears are Westmorland, Huntingdonshire, Shropshire, Berkshire, Norfolk, Cornwall, and Wiltshire. Compared, however, with the marriages in the third quarter of 1872, a decline is exhibited in twenty-one counties, including Cheshire, the extra-metropolitan part of Surrey, Essex, Lancashire, Warwickshire, and Monmouthshire.

Births.—In the quarter ending 30th September the births of 204,167 children were registered in England and Wales; the equivalent annual

birth-rate was 34·7 per 1000, the same as for the September quarter of 1872, and 0·5 above the mean rate for the corresponding quarter in the ten years 1863-72. In two of the eleven Registration Divisions, the South-eastern and South-western, the births fell short of the averages taken from the numbers registered in them respectively in the three previous corresponding quarters. In seventeen counties the births registered last quarter were below the averages similarly obtained, the deficiency being greatest in North Wales, Herefordshire, Buckinghamshire, Bedfordshire, Dorsetshire, and Wiltshire. The excess over the average numbers was greatest in the counties of Durham, Leicester, Monmouth, Nottingham, Stafford, and Northampton, and in South Wales. The birth-rate in the eighteen largest English towns was 36·3, or 1·7 above that for the whole of England and Wales. The lowest rates were 31·0 in Norwich and 34·3 in London, both being below the rate for the whole country: the highest were 42·0 in Sheffield, 42·1 in Sunderland, and 45·5 in Leicester. In the fifty towns ranking next in order of population, the birth-rates averaged 35·8, and ranged from 21·5, 25·3, and 26·3 in Cheltenham, Bath, and Hastings respectively, to 46·0 in Wigan, 47·7 in Merthyr Tydfil, and 51·9 in Dudley.

Increase of Population.—The excess of births over deaths during the three months ending 30th September was 89,491, or at the rate of 973 per day. Emigration was more active than in the corresponding quarter of any year since 1854, 60,093 persons of British origin having sailed during the three months from ports at which Government emigration officers are stationed. Of these 60,093 emigrants, 36,777 were English, 5743 Scotch, and 17,573 Irish; the proportions to a million of the respective populations of the three countries being, English 1575, Scotch 1674, and Irish 3288. In the previous summer quarter the English emigrants numbered 36,135, the Scotch 5309, and the Irish 15,334. The destinations of the 60,093 emigrants last quarter were as follow: of 42,453 the United States; of 9667 British North America; of 6524 the Australian Colonies; and the remaining 1449 were distributed amongst other places. There was a considerable increase in the number of those who sailed to the Australian Colonies.

Prices, Pauperism, and the Weather.—The price of wheat in the Michaelmas quarter 1873 averaged 61s. 4d. per quarter, showing an advance of nearly 5s. upon the average price in the preceding three months, and of 2s. 5d. upon that in the corresponding quarter of 1872. In the ten years 1863-72, the mean price for the September quarter was 52s. 5d. In the early part of last quarter old potatoes were so scarce that no regular quotations of prices could be given, but later the prospect of a better crop this year induced a lower range of prices than prevailed at the same season of last year. Best Regents averaged 94s. 6d. per ton at the Borough and Spitalfields Markets during August and September, against 119s. in the corresponding period of 1872. The mean price for the September quarter in the ten years 1863-72 was 106s. Meat was slightly cheaper than in the previous three months, the average prices of beef and mutton by the carcase at the Metropolitan Meat Market having been 7½d. and 7¾d. per lb. respectively last quarter, against 7¾d. and 8½d. in the June quarter. For the third quarter of the previous ten years the average price of beef was 6d., and of mutton 6¾d. per lb. The average price per ton of seaborne coal in the London Market was 30s. 1d., or 10d. higher than in the quarter ending 30th June. In the September quarter of 1872 it was 27s. 6d., and in the corresponding quarter of 1871 only 17s. per ton.

The returns of pauperism for last quarter, when compared with those for the corresponding quarter of 1872, show a slight increase in the average number of in-door paupers, and a considerable diminution in the

average number of out-door paupers relieved on the last day of each week. The proportion of each class of paupers in the third quarter of each of the three years 1871–2–3 to 1000 of the estimated population was as follows :—

	In-door.	Out-door.
Quarter ending 30th September 1871	5·8	33·8
" 1872	5·5	29·6
" 1873	5·5	27·1

Till the 19th July the weather was mostly cold, the mean daily temperature being $\frac{3}{4}^{\circ}$ below the average. On July 20th a sudden change took place, and for a few days the weather was fine and hot, particularly on the 21st, 22nd, and 23rd; the mean temperatures of these days were $71^{\circ}\cdot7$, $75^{\circ}\cdot2$, and $72^{\circ}\cdot3$, exceeding their averages by $10^{\circ}\cdot2$, $13^{\circ}\cdot7$, and $10^{\circ}\cdot7$ respectively. From this time till September 2nd the weather was changeable, a few days of cold and a few days of warm weather alternating; the warm days, however, were the more numerous, and upon the whole of the 45 days ending September 2nd there was an excess of temperature averaging $2\frac{1}{2}^{\circ}$. Then followed a cold fortnight, after which the weather continued for the most part cold to the end of the quarter, the deficiency of mean temperature for the last 28 days averaging rather more than 2° daily. The mean temperature for the quarter was $60^{\circ}\cdot3$, or $0^{\circ}\cdot6$ above the average in 102 years. In July the excess was $1^{\circ}\cdot8$, and in August $1^{\circ}\cdot9$; in September there was a deficiency of $1^{\circ}\cdot8$. Rain fell very frequently during the first half of July, the whole of August, and the first half of September. The rain-fall at Greenwich during the three months amounted to 7·6 inches, agreeing with the average of 58 years. In July, there was a deficiency of 0·7 inches, in August an excess of 0·8 inches and in September there was exactly the average amount. The mean amount of rain collected between latitudes 50° and 55° was 8·30 inches; it was only 6·90 inches between latitudes 52° and 53° , and 10·14 inches between latitudes 54° and 55° .

State of the Public Health; Deaths.—In the third or summer quarter of this year 114,676 deaths were registered. The annual death-rate was so low as 19·5 per 1000, and 1·9 per 1000 lower than the average rate in the corresponding quarters of the 10 years 1863–72. The death-rate last quarter was lower than in the corresponding period of any year since the remarkably cold and wet summer of 1862, when the deaths were equal to but 13 per 1000 annually of the population. Had the death-rate last quarter been equal to the average rate in the ten last summers, nearly 12,000 more persons would have died, than those whose deaths were actually recorded. A very large proportion of this decrease in the number of deaths was due to the continuance of a marked decline in the fatality of the principal zymotic diseases.

In the eleven Registration Divisions of England and Wales, the annual death-rate in the quarter ranged from 15·0 and 15·3 per 1000 in the agricultural counties of the South-western and South-eastern Divisions, to 23·2 and 23·5 in the principally manufacturing and mining counties of the North-western and Northern Divisions. Durham and Northumberland were the only counties in which the deaths registered in the quarter exceeded the average numbers returned in the three preceding corresponding quarters.

The population of the Registration Districts and sub-districts containing all the chief towns of England and Wales is now estimated at about 13 millions and a half of persons; the annual death-rate among this large urban population was equal to 22·0 per 1000 during the quarter, and was 2·1 below the average rate in the ten previous corresponding quarters. In the remaining and principally rural population of about 10 millions the death-rate did not exceed 16·0 per 1000, which was 1·7

below the same average. Compared with the average rate in recent corresponding quarters, the urban mortality again showed a larger actual decline than did the rural death-rate, although relatively considered the improvement in the health of rural districts bears similar satisfactory evidence of sanitary progress to that exhibited in the returns from our urban population.

In eighteen of the largest English towns, including London, containing an estimated population of about six millions and a half, the annual mortality in the quarter averaged 23·9 per 1000, exceeding by nearly 2 per 1000 the general urban rate. The lowest rates among these eighteen towns were 17·5 in Portsmouth and 20·3 in Norwich; the highest rate was 29·9 both in Manchester and Newcastle-upon-Tyne. Diarrhœa caused a considerable mortality in most of the large towns, and scarlet fever was somewhat fatally prevalent in Wolverhampton, Birmingham, Manchester, Leeds, and Newcastle-upon-Tyne.

In the districts and sub-districts taken as approximately representing fifty other large towns, ranking in respect of population next in size to the eighteen largest English towns, and estimated to contain a population of rather more than two millions and a half, the death-rate in the quarter was equal to 21·0 per 1000, and was 2·9 below the average rate in the eighteen largest towns. Among these fifty towns the following showed rates below 17 per 1000:—Cheltenham 13·6, Dover 15·3, Devonport 15·9, Hastings 16·1, Worcester 16·1, Bath 16·2, Chester 16·4, and Northampton 16·9; the fatality of zymotic diseases was especially low in Bath, Chester, and Cheltenham. Death-rates exceeding 27 per 1000 prevailed in the following towns:—South Shields 27·6, Blackburn 27·6, Yarmouth 27·8, Stockport 27·8, Gateshead 31·2, Preston 31·8, and Wigan 32·0; the fatality of scarlet fever contributed to the excessive rates in Blackburn, Preston, and Gateshead, while in Yarmouth, Stockport, Wigan, and South Shields the mortality from diarrhœa was exceptionally high.

The 114,676 deaths registered in the whole of England and Wales included 35,252 or 31 per cent. of infants under one year of age, and 24,524 or 21·4 per cent. of persons aged 60 years and upwards. To each 100 births registered during the quarter, 17·3 deaths of infants under one year of age were recorded, against 20·0, 19·4, and 18·2 per cent. respectively in the corresponding periods of the three years 1870–1–2. Infant mortality, measured in this way, was equal to 20·2 per cent. in the North-western Division, containing the counties of Lancashire and Cheshire; while it was only 11·0 per cent. in Wales, and in the agricultural counties of the South-western Division. In eighteen of the largest English towns, including London, this proportion of infant mortality (which is in the summer quarter of the year principally governed by the fatality of diarrhœa) averaged 24·3 per cent. upon the births registered, and ranged from 16·7 and 17·0 in Portsmouth and Oldham, to 30·6 and 34·0 in Liverpool and Leicester. Infant mortality in Leicester, although so excessive, showed a decline from the still higher proportion, 40·5 per cent., which prevailed in the corresponding period of last year. The largest portion of the decline in the deaths registered in England and Wales in the quarter occurred among those of children and adults aged between 1 and 60 years, probably due in great measure to the marked decline in the fatality of small-pox, measles, and whooping-cough. The deaths of persons aged 60 years and upwards in the quarter slightly exceeded the number returned in the corresponding period, of either of the three preceding years; and the proportion to total deaths, which had been 19·4 in the third quarter of 1870 and 1871, and 20·4 in the same period of 1872, further rose to 21·4. With a decline in infant mortality and of the deaths of children, and an increase in the proportion of deaths of persons aged 60 years and upwards, it may fairly be assumed that the

mean age at death in England and Wales was higher than it had been in recent corresponding periods.

The present return shows a continuance of the decline in deaths referred to the principal zymotic diseases which has been noticed in recent quarters. During the three months ending September, 277 were reported from small-pox, 1180 from measles, 2593 from scarlet fever, 502 from diphtheria, 1666 from whooping-cough, 3053 from different forms of fever, and 13,925 from diarrhoea; in all, 23,196 deaths resulted from these seven principal zymotic diseases, against 33,963, 31,388, and 27,428, in the corresponding quarters of the three years 1870-1-2. If the increase of population be taken into account, the annual death-rate from these seven diseases in the quarter was equal to 3·9 per 1000 of the estimated population, while in the three preceding corresponding quarters it had been 6·0, 5·5, and 4·7, respectively. A large proportion of the zymotic rate in the summer quarter of the year is always caused by the fatality of diarrhoea. In the eighteen large English towns the annual death-rate from the seven zymotic diseases averaged 6·6 per 1000, and ranged from 3·5 and 3·7 in Oldham and Bristol, to 9·4 and 11·5 in Birmingham and Leicester. In fifty other large towns the death-rate from these diseases averaged 4·5 per 1000, and while it was less than 2 per 1000 in Bath, Cheltenham, Chester, Halifax, and Newport (Monmouth), it equalled or exceeded 10 per 1000 in Dudley, Preston, and Gateshead.

During the three months ending September 13,925 deaths were referred to diarrhoea in England and Wales; in the three preceding corresponding quarters the numbers were 17,647, 15,919, and 14,681. Judging from the weekly returns received from an aggregate population of nearly six millions and a half of persons estimated now to be living in eighteen of the largest English towns, including London, the usual summer fatality of diarrhoea reached its maximum about the middle of August, and afterwards declined rapidly. The 13,925 deaths from diarrhoea during the three months were equal to an annual death-rate of 2·4 per 1000 throughout England and Wales; in the summer quarters of 1870-1-2 it was respectively 3·1, 2·8, and 2·5. In eighteen of the largest towns the diarrhoeal rate averaged 4·5 per 1000, ranging from 1·9 and 2·8 in Bristol and Portsmouth, to 6·7 and 10·4 in Salford and Leicester. Among the fifty other large towns the death-rate from diarrhoea averaged 2·9 per 1000, was less than one per 1000 in Bath, Halifax, and Merthyr Tydfil, while it was 7·9 and 8·1 respectively in South Shields and Wigan. The variations in the death-rate from diarrhoea in the several large towns is very remarkable; for instance, during the four summer quarters of 1870-1-2-3 it averaged 9·8 in Leicester and 9·6 in Wigan, whereas it was but 0·7 per 1000 in Merthyr-Tydfil. As fully 80 per cent. of the deaths from diarrhoea are of infants under two years of age, the fatality of this disease has an important influence upon infant mortality, and may be in some degree dependent upon the low constitutional stamina of the infants, but must be mainly due to the bad water supply, the defective sanitary condition of the houses, the improper food of the children, or the neglect of the mothers. Why diarrhoea is so fatal among infants at Leicester and Wigan, and why the infants at Merthyr Tydfil escape this fatality, would be a subject for inquiry at once interesting and useful. In the remainder of England and Wales, that is excluding these sixty-eight large towns, the death rate from diarrhoea last quarter was equal to but 1·3 per 1000, against 1·6 and 1·5 in the summer quarters of 1871 and 1872. The summer epidemic of infantile diarrhoea is essentially an urban epidemic, and in the agricultural counties of the South-western Registration Division the annual death-rate from diarrhoea last quarter was only equal to 0·8 per 1000, while in the manufacturing counties of Cheshire and Lancashire, making up the North-western Division, it was 3·4. According to the Census

taken in 1871, the proportion of the population living in towns with 20,000 inhabitants and upwards was only 12·8 per cent. in the South-western, and so high as 56·7 per cent. in the North-western Divisions. It may fairly be expected that the improved sanitary organization which is being steadily, though slowly, developed, will before long exercise an important influence upon the present unsatisfactory condition of our infant population living in large towns.

To simple cholera and choleraic diarrhoea 494 deaths in England and Wales were referred in the quarter, against 527 and 471 in the two preceding corresponding quarters; they therefore differed but slightly from the numbers in recent summers. These 494 deaths included 144 in London, and 100 in the North-western Division, and bore generally a relative proportion to the deaths from diarrhoea. In some cases, however, it is exceedingly probable that severe cases of simple diarrhoea are sometimes returned as choleraic diarrhoea or English cholera; in connection with this suggestion it is worthy of note that in the registrar's sub-district of Carlton near Nottingham, not a single death was referred to diarrhoea, whereas of 25 deaths from all causes five of infants under two years were ascribed to cholera, the cause of death in each case being certified by the same medical practitioner.

Next to diarrhoea, different forms of fever caused more deaths in the quarter than any other zymotic disease. The deaths referred to fever were 3053, against 4635, 3362, and 3195 in the three preceding corresponding quarters, showing a continuous decline, which bears evidence of improved sanitary conditions. The annual death-rate from fever was equal to 0·52 per 1000, but was 0·97 in the county of Durham, the fatal cases being relatively most excessive in Stockton, Hartlepool, Bishop Auckland, and Durham. An examination of the returns in detail shows that fever, principally of a typhoid form, was fatally prevalent in many small towns and villages, among which may be mentioned Sherborne, Saltash, Kenwyn (Truro), Atherstone, Gomersal, and Blaenavon.

The returns bear evidence of an increasing fatality of scarlet fever. The deaths from this disease, which in the third quarters of 1870-1-2 had been 7498, 3488, and 2423 respectively, rose to 2593, and exceeded the number in the preceding three months by 505. Of these deaths from scarlet fever 828 occurred in the eighteen large English towns, including 158 in London, 161 in Birmingham, 133 in Leeds, 114 in Manchester, 69 in Newcastle, and 48 in Wolverhampton; they were also excessive in Dudley, Blackburn, Preston, Gateshead, Chester-le-Street, Runcorn, Audenshaw, Deeping, Leyland, Golcar, South Creake, Combmartin, Yeovil, Ruabon, Ystradyfodwg, and Portmadoc. The fatal cases of diphtheria were 502, against 474 and 406 in the two preceding corresponding quarters; this disease was especially fatal at Baschurch (Salop) and at Penarth, near Cardiff.

Whooping-cough, which caused 1666 deaths, was less fatal than in any quarter since the beginning of 1870; 584 occurred in London, where the disease was relatively more prevalent than in any of the other registration divisions. The deaths from measles, which in the third quarters of the three years 1870-1-2 had been 1390, 1688, and 1267, did not exceed 1180 in that of 1873; these 1180 deaths included 664 in the eighteen large towns, of which 353 occurred in London, 96 in Sheffield, 75 in Liverpool, and 47 in Manchester. Measles was more or less fatally epidemic in Leek, Festiniog, and Combmartin in North Devon.

Small-pox as an epidemic, which was so fatal during the whole of 1871, and the greater part of 1872, declined during 1873. This epidemic reached its climax in the first quarter of 1872, when 7720 fatal cases were registered; the quarterly numbers afterwards steadily and rapidly declined, and only 277 deaths were referred to the disease in the third quarter of 1873, which is probably the smallest number that occurred in any

quarter since the beginning of the present century. Only one death from small-pox occurred in the eight counties forming the South-midland Division, and only 15 among the population of three millions and a quarter of persons living within the Metropolitan area. The disease was, however, somewhat prevalent at Gloucester, Birmingham, Bolton, Bradford, Dewsbury, Stockton, Hartlepool, Whitehaven, and Pontypridd.

An examination in detail of the present return, as usual, discloses many instances of excessive death-rates and fatality from zymotic diseases, in small villages and rural sub-districts, but the numbers being small, and the localities not widely known, the cases are apt to escape general attention. The registration sub-district of Combmartin in North Devon is a case in point; it has an almost stationary population of about 3600 persons, among whom 33 deaths were registered last quarter, whereas the average number in the corresponding quarter of the three previous years is but 13. These 33 deaths included 10 fatal cases of scarlet fever and 8 of measles, all of which occurred within the parish of Combmartin, which has a population of only 1400 persons; this would be equal to an annual death-rate of more than 50 per 1000 from these two diseases alone, whereas the annual rate from these diseases in the whole of England and Wales in the quarter did not average one per 1000.

In the workhouses, hospitals, and lunatic asylums 9244 deaths were recorded in the quarter, or 8 per cent. of the total deaths; in the corresponding quarter of last year the proportion was 7·8 per cent. Half of these institution deaths were recorded in the eighteen large English towns, among which the proportion to total deaths averaged 11·9 per cent., and ranged from 6·5 in Sheffield, to 12·3, 13·5, and 15·1 per cent. respectively in Liverpool, Bristol, and London. During the three months 6046, or 5·3 per cent., of the deaths were registered upon the information of the coroner, being inquest cases. In the eighteen large towns the inquests were equal to 5·7 per cent. of the deaths, and in the several towns the proportion ranged from 2·3 per cent. in Sunderland to 7·4 and 7·8 respectively in Portsmouth and Birmingham. In considering these proportions it appears difficult to avoid one of two conclusions: either too few inquests are held in Sunderland, or an unnecessary number of such inquiries take place in Portsmouth and Birmingham.

LONDON.—The health of the population residing within the Metropolitan registration area, estimated at rather more than three and a quarter millions of persons, was comparatively satisfactory during the quarter; the annual death-rate during that period was equal to 21·8 per 1000, against 23·4, 22·9, and 21·4, respectively, in the three preceding corresponding quarters, and was 4·3 per 1000 lower than the average rate in the seventeen next largest English towns, with an aggregate population about equal to that of London. The deaths referred to the seven principal diseases of the zymotic class were 4731, of which 3170 were fatal cases of diarrhoea, 584 of whooping-cough, 375 of fever, 353 of measles, 158 of scarlet fever, 76 of diphtheria, and only 15 of small-pox. These 4731 deaths were equal to an annual rate of 5·7 per 1000, whereas in the seventeen other largest towns this zymotic rate was 7·6 per 1000. Compared with the numbers of deaths returned from these seven zymotic diseases in the two previous corresponding quarters, the fatal cases of whooping-cough, fever, measles, and diarrhoea showed an increase, while those of small-pox and scarlet fever had declined. The most unsatisfactory feature is the increase in the deaths from different forms of fever: the deaths from this cause, which in the three preceding corresponding quarters had successively been 545, 355, and 316, rose again last quarter to 375, including 56 cases of typhus, 240 of typhoid or enteric fever, and 79 of simple continued fever. The annual death-rate from fever in the whole of England and Wales last quarter averaged 52 per 100,000 of the population, and in London it was 45. The 15 deaths from small-pox was

by far the lowest number returned from this disease in any quarter of any year since the beginning of 1840; it is worthy of note that 9 of these deaths from small-pox occurred in East London, which usually suffers most severely from the disease when it is epidemic. Diseases of the respiratory organs and phthisis caused 3902 deaths in London, against 3830 in the third quarter of last year; the annual rate of mortality from these diseases was equal to 4.7 per 1000, while the rate from the same diseases was 5.8 in Liverpool and 4.8 in Birmingham. The influence of temperature and other meteorological features upon the mortality of persons at different ages from the various forms of disease in London can be investigated in detail from the information published in the Weekly Returns. This will acquire greater value when similar information is rendered available by the publication of returns from the medical officers of health who have recently been appointed for numerous urban and rural sanitary districts. It is of the first importance that these returns should be sufficiently uniform to render useful comparison possible.

The violent deaths in London in the three months were 671, against 588, 635, and 664 in the three preceding corresponding quarters; 550 were referred to different forms of accident and negligence, 72 to suicide, and 35 to murder and manslaughter, including infanticide. The deaths of 64 persons directly resulted from accidents caused by horses or vehicles in the streets, from which class of accident 860 cases of injury and maiming came under the notice of the Police within the London registration area, during the thirteen weeks ending 28th September.

HEALTH OF FOREIGN CITIES.—The following facts relating to Indian or Foreign Cities are derived from official returns furnished by various authorities abroad:

In Paris 10,589 deaths were recorded in the quarter, giving an annual death-rate of 23.0 per 1000: during the last three weeks of the quarter 320 deaths were caused by cholera. In Brussels the births were 1510 and the deaths (excluding those of strangers, *i.e.* of persons not ordinarily resident within the city) 1190, the respective rates being 32.8 and 25.8. The 8627 deaths from all causes in Berlin, implying an annual death-rate of 41.8 per 1000, included 535 deaths, or 2.6 per 1000, from cholera. In Vienna the deaths (excluding those of strangers) numbered 7004 and included 2533 from cholera: the death-rate from all causes was 43.6 and from cholera 15.8. In Rome the number of persons married was 644, or at the rate of 10.6 per 1000; the number of births 1757, or at the rate of 28.8; and the number of deaths 1827, or at the rate of 30.0. In Florence there were 550 persons married, 1672 births, and 1270 deaths, giving rates of 13.2, 40.2, and 30.5 respectively. In Turin the persons married numbered 602, the births 1624, and the deaths 1276; the corresponding annual rates were 11.4, 30.7, and 24.1 per 1000. The 1604 deaths in Amsterdam implied an annual rate of 23.2, and the 602 deaths in the Hague to a rate of 26.0 per 1000. Returns received from Copenhagen show the total number of deaths in that city to have been 1286, and the equivalent annual rate 25.8.

In the thirteen weeks ending 30th September, 3671 deaths were registered in Bombay, giving a death-rate of 22.8. In Calcutta 2446 deaths, implying a rate of 21.9 annually, were returned in the thirteen weeks ending 13th September. The 3485 deaths in Madras recorded during the quarter ending 12th September showed a death-rate of 35.2, and included 635 from different forms of fever.

The returns from New York state the deaths during the quarter to have been 8954, of which 3028 were caused by diarrhoea; the annual death-rate from all causes was 35.9, of which 12.2 was due to fatal cases of diarrhoeal diseases, against a rate of 4.0 per 1000 from the same diseases in London. The 4436 deaths returned in Philadelphia were equal to a rate of 23.7 per 1000 annually.

Fourth Quarter.—October, November, December.

IN the UNITED KINGDOM the marriages of 148,656 persons, the births of 265,095 children, and the deaths of 166,671 persons of both sexes, were registered in the three months ending 31st December 1873. The natural increase of population was thus 98,424.

ENGLAND.—The births in the autumn quarter that ended the year 1873, though fewer in proportion than in the previous autumn, were above the average of the season. The public health was in a favourable state, and the mortality was below the average both in town and country. The extremely severe cold week of December was accompanied by a remarkable continuance of dense fog in London, which, fatal to many, deprived it of its usual superiority over the other great cities of the kingdom. The chief zymotic diseases have been comparatively quiescent, but the public health requires watchful care, for measles, scarlet fever, and diphtheria are on the increase, and may devastate unguarded cities. The ruling prices of wheat, meat, and coals remain high.

Marriages.—The marriages in the fourth quarter of the year 1873 were more numerous than in any preceding quarter. They gradually increased from 51,393 in the corresponding quarter of 1868 to 61,281 in the three last months of 1873. The marriage-rate, which was 20·8 to 1000 persons living, or 0·8 above the mean rate for the autumn quarter in the ten years 1864–73, has never been exceeded since the autumn quarter of 1865, when it was 21·4. Compared with the average numbers for the corresponding quarter in the three previous years, the marriages in the manufacturing and mining counties of Stafford, Lancaster, and Durham, in the West Riding of York, and in South Wales showed an increase, while in the agricultural counties of Cambridge, Devon, Hereford, and Westmorland the marriages declined. The cause will be referred to under the head of prices.

Births.—The number of births registered in the quarter ending 31st December 1873 was 203,351, or 3,268 less than in the corresponding quarter of the previous year. Allowing for increase of population, the birth-rate per 1000 persons living was 34·5, or 0·9 lower than in the quarter ending 31st December 1872, but 0·3 above the mean rate for the fourth quarter in the ten years 1863–72. A comparison of the number of births registered in the quarter, with the average in the three previous corresponding quarters, for each Registration Division and County, shows that the births fell short of the respective averages in fourteen counties, the greatest proportionate deficiency being in the small counties of Huntingdon and Westmorland, and in Shropshire, Dorsetshire, and Bedfordshire. London exhibited the largest proportionate excess; then the counties of Durham, Leicester, the extra-metropolitan part of Middlesex, Monmouth, and Northumberland.

The normal birth-rates vary considerably in different parts of the country. Thus, in the year 1871 the rate in Durham was 42·4, and in Somersetshire 30·9 per 1000, and the mean rates in the ten years 1861–70 for these two counties had been 42·0 and 30·7 respectively. The principal immediate cause of this wide difference would naturally be looked for in the proportions of married women at the child-bearing ages to the total population. Accordingly it is found from the Census of 1871, that in that year in the county of Durham, with an enumerated population of 742,205, the number of females between the ages of 15 and 45 was 156,713, of whom 93,873, or about 60 per cent., were married; while in Somersetshire, with an enumerated population of 482,652, the number of females between the above-mentioned ages was 107,390, of whom 48,357, or only about 45 per cent., were married. The proportion of married women between 15 and 45 years of age to the total population was thus in

Durham 13 per cent., and in Somersetshire 10 per cent. It should be remarked that the number of males to 100 females enumerated was in Durham 107 and in Somersetshire 90. The greater prevalence of early marriages in Durham is shown by the fact that 18,099, or 5 per cent., of the total females in that county, and 6434, or only $2\frac{1}{2}$ per cent., of the total females in Somersetshire, were wives under 25 years of age.

In the eighteen most populous English towns the birth-rates in the quarter averaged 37.0 per 1000, exceeding the rate for the whole of England and Wales by 2.1, and ranged from 32.5 in Portsmouth and 32.9 in Norwich, to 42.9 in Sheffield and 45.2 in Leicester. The average rate in the fifty next largest towns was 35.5, or 1.5 below that in the eighteen largest; of the rates in these fifty towns the lowest were 23.0 in Cheltenham, 25.8 in Plymouth, and 26.3 in Shrewsbury, and the highest were 43.0 in Wigan, 44.1 in South Shields, and 48.6 in Dudley.

Increase of Population.—The births during the quarter ending 31st December exceeded the deaths by 76,521. During the same period 33,172 emigrants of British origin sailed from ports at which emigration officers are stationed, against 37,855 in the last quarter of 1872. Of these 33,172 emigrants, 21,621 were English, 2801 Scotch, and 8750 Irish; the proportions to a million of the respective populations of the three countries being English 926, Scotch 816, and Irish 1637. The destination of 20,042 was the United States; of 2289 British North America; of 9035 the Australian Colonies; and the remaining 1806 were bound for other places. A continued increase is observed in the number of emigrants attracted to the Australian Colonies.

Prices, Pauperism, and the Weather.—The average price of wheat for the quarter ending Christmas 1873 was 61s. 1d. per quarter, differing very slightly from that in the previous quarter ending Michaelmas, but showing an increase of 3s. 10d. upon the average price for the Christmas quarter of 1872, and of 10s. upon the mean price for the corresponding three months in the ten years 1863–72. Potatoes were much cheaper than at the corresponding season of the previous year, best Regents averaging 107s. per ton at the Borough and Spitalfields markets in the quarter, against 170s. in the December quarter of 1872. The mean price for the fourth quarter in the ten years 1863–72 was 99s. 6d. per ton. A further slight reduction is to be noticed in the price of meat, the average prices per lb. of beef and mutton by the carcass at the Metropolitan Meat Market, having declined from $7\frac{1}{4}$ d. and $7\frac{7}{8}$ d. respectively in the September quarter to $6\frac{3}{4}$ d. and $7\frac{1}{2}$ d. In the quarter ending 31st December 1872 beef averaged $6\frac{3}{4}$ d., the same as in this quarter, and mutton $7\frac{1}{4}$ d. per lb.; for the corresponding quarter in the ten years 1863–72 the mean prices were $5\frac{7}{8}$ d. and $6\frac{3}{4}$ d. per lb. respectively. Seaborne coal averaged 30s. 8d. per ton in the London market; it was slightly dearer than in the previous quarter, when the average price was 30s. 1d. per ton. In the corresponding periods of 1872 and 1871 the average prices were 26s. 5d. and 19s. 9d. respectively.

The returns of pauperism, compared with those for the corresponding quarter of 1872, show a slight decline in the number both of in-door and out-door paupers.

In the first week of October there was an excess of mean temperature averaging $3\frac{1}{4}^{\circ}$ daily; then followed two cold and two warm days, after which there was a cold period of more than a month's duration, in which the average daily deficiency of mean temperature was $3\frac{1}{2}^{\circ}$. From 17th November to 7th December the weather was again mostly warm. A week of very severe cold weather ensued, the deficiency of temperature on the 9th, 10th, and 11th December being $11\frac{1}{2}^{\circ}$, $16\frac{1}{2}^{\circ}$, and $12\frac{1}{2}^{\circ}$ respectively, and these days in London were distinguished by a most remarkable continuance of very dense fog. A warm period then set in, and continued

with slight exception to the end of the year ; on the 16th, 17th, and 18th the daily temperatures were $10^{\circ}\cdot8$, $10^{\circ}\cdot0$, and $10^{\circ}\cdot6$ above their respective averages, and the mean temperature of these three days was 24° higher than that of the 9th, 10th, and 11th. The mean temperature of the quarter was $0^{\circ}\cdot5$ above the average in 102 years. The rain-fall at Greenwich during the quarter amounted to 5·5 inches, or 1·6 inches less than the average in 58 years. The deficiency in the month of December was 1·7 inches, the total fall in that month having been only 0·3 of an inch, and less than in any December since 1829. Between latitudes 50° and 55° the mean amount of rain collected during the quarter was 6·82 inches, or but little more than half the amount which fell in the three months ending 31st December 1872.

State of the Public Health ; Deaths.—In the last three months of 1873 there were 126,830 deaths registered. The annual death-rate was equal to 21·5 per 1000, and 0·7 lower than the average rate in the corresponding quarters of the ten years 1863–72 ; in those ten years the only lower rates were 20·2 in the last quarter of 1872 and 21·3 in 1867, whereas in the other years the rate ranged upwards to 23·4 and 23·5 in 1871 and 1864 respectively.

In the eleven Registration Divisions of England and Wales the annual death-rate in the quarter ranged from 16·3 and 17·7 in the agricultural counties of the South-eastern and Eastern Divisions, to 25·1 in the principally mining population of the Northern Division, and 25·4 in London. The deaths in Northumberland exceeded by 22·5 per cent. the average number in the three preceding corresponding quarters, and were equal to an annual rate of 27·1 per 1000 ; the rate of mortality was most excessive in Newcastle-upon-Tyne, Tynemouth, Hexham, and Alnwick.

In the population of the Registration Districts and sub-districts, containing the chief towns of England and Wales, estimated at about thirteen millions and a half of persons, the annual death-rate in the quarter was equal to 24·7 per 1000, and was 0·1 below the average rate in the ten previous corresponding quarters. In the remaining and principally rural population of about ten millions the death-rate did not exceed 17·9 per 1000, and was 0·8 below the same average. In the urban districts, the average density of the population in 1871 was 4 persons to an acre, while in the rural districts there were nearly 4 acres to each person.

In eighteen of the largest English towns, including London, containing a population estimated at about six millions and a half, the annual mortality in the quarter averaged 25·5 per 1000, and exceeded by nearly one per 1000 the general urban rate. The death-rates in the several towns ranged from 20·4 and 20·5 in Norwich and Portsmouth, to 30·8 and 33·4 in Leeds and Newcastle-upon-Tyne ; the excessive rates in the two latter towns were principally due to the fatal prevalence therein of scarlet fever.

In the districts and sub-districts taken as approximately representing fifty other large towns, ranking in respect of population next in size to the eighteen largest English towns, and estimated to contain a population of rather more than two millions and a half, the death-rate in the quarter averaged 23·7 per 1000, and was 1·8 below the average rate in the eighteen largest towns. The towns showing death-rates below 17 per 1000 were :—Dover 13·9, Maidstone 15·9, Cheltenham 16·2, Hastings 16·2, and Gosport 16·5. Death-rates exceeding 30 per 1000 prevailed in the following towns :—Lincoln 30·3, Dudley 30·4, Gateshead 32·8, Merthyr Tydfil 34·4, Blackburn 35·5, and Preston 42·2. The excessive mortality in these towns was almost entirely due to the prevalence of scarlet fever in an epidemic form.

The 126,830 deaths in England and Wales included 30,400, or 24 per cent., of infants under one year of age, and 32,280, or 25 per cent., of persons aged 60 years and upwards. To each 100 births registered dur-

the quarter 14·8 deaths of infants under one year of age were recorded against 15·7 and 13·7 per cent. respectively in the corresponding quarters of 1871 and 1872. Infant mortality measured in this way was equal to 16·6 per cent. in the Northern counties, containing principally a mining population, whereas it did not exceed 10·7 per cent. in the agricultural counties of the South-eastern Division. In eighteen of the largest English towns, including London, this proportion of infant mortality to births registered averaged 16·7 per cent., and ranged from 11·8 in Norwich to 18·6 in Liverpool and Newcastle-upon-Tyne, 19·8 in Wolverhampton, and 23·0 in Bradford. The proportion of deaths of elderly persons in England and Wales was slightly lower than that which prevailed in the same period of last year, whereas it was considerably higher than in the last three months either of 1870 or 1871. The per-centage to total deaths of those at 60 years of age and upwards averaged 20·7 in the eighteen towns, and ranged from 14·1 in Leeds to 37·2 per cent. in Norwich; in Leeds the fatality of zymotic diseases, especially of scarlet fever, caused an excessive proportion of deaths between one and 60 years, and the comparative immunity from zymotic disease which prevailed in Norwich had the opposite result in that city.

The return for the last three months of 1873 shows a somewhat general increase in the prevalence and fatality of zymotic disease. The registrars report that during the quarter 249 deaths were referred to small-pox, 3233 to measles, 5576 to scarlet fever, 719 to diphtheria, 1863 to whooping-cough, 3810 to different forms of fever, and 3439 to diarrhoea; in all, 18,889 deaths resulted from these seven principal zymotic diseases, against 26,997 and 16,794 in the corresponding quarters of 1871 and 1872. The annual death-rate from these seven diseases last quarter was equal to 3·2 per 1000, while in the last quarters of the three years 1870-1-2 it had been 4·6, 4·7, and 2·9 respectively. In the eighteen large English towns this annual zymotic-rate averaged 4·0 per 1000, and ranged from 1·5 and 2·4 in Norwich and Hull, to 7·9 and 8·8 in Leeds and Newcastle-upon-Tyne. In fifty other large English and Welsh towns the death-rate from these diseases averaged 4·3 per 1000, and while it was less than one per 1000 in Cheltenham and Rochester, it ranged upwards in the other towns to 11·8 in Gateshead, 15·1 in Preston, and 15·4 in Blackburn. Scarlet fever was fatally prevalent in each of these three towns, measles also being epidemic in Blackburn.

The recent epidemic of small-pox reached its climax in the first quarter of 1872, when 7720 deaths resulted therefrom, after which the quarterly numbers rapidly and steadily declined to 249 in the three months ending September 1873, the smallest number referred to this disease in any quarter in recent years. The 249 included 99 in eighteen of the largest English towns, of which 40 occurred in Leeds, 38 in Birmingham, and 17 in London; 29 also occurred in Gloucester, 10 in Dewsbury, 26 in Whitehaven, and 13 in Pontypridd Districts. Only 3 deaths were referred to small-pox in the South-eastern, South-midland, and Eastern Registration Divisions, containing a population of about five millions.

Measles caused 3233 deaths in England and Wales in the quarter, against 1180 in the preceding three months; in the fourth quarters of 1871 and 1872 the numbers were 3763 and 1341 respectively. Of the 3233 in the quarter, 1851 occurred in the eighteen large English towns, including 1420 in London, 104 in Liverpool, 94 in Birmingham, and 64 in Bristol. Measles also showed an exceptional fatality in Wilton, Tamar, Bideford, Bath, Foleshill, Warrington, Middleton (near Oldham), and Blackburn.

Scarlet fever showed a largely increased fatality, causing 5576 deaths, against 2088 and 2593 in the two preceding quarters of the year. In the eighteen large English towns 1724 deaths were referred to this disease, including 365 in Leeds, 283 in London, 227 in Birmingham, 228 in Manchester and Salford, 222 in Newcastle-upon-Tyne, 145 in Liverpool, and

132 in Sheffield. The deaths from scarlet fever showed a considerable increase upon the numbers returned in the preceding quarter in each of the Registration Divisions; this increase was proportionally largest in Durham, Northumberland, the West Riding of Yorkshire, and Lancashire. Among those places in which the mortality from this disease was most excessive in the quarter may be specified:—Langport, Dudley, Lincoln, Market Rasen, St. Helen's, Blackburn, Preston, the village of Rothwell, Barnsley, Gateshead, Carmarthen, Ruabon, Llanrwst, and Tremadoc. Diphtheria as well as scarlet fever showed an increased fatality; the fatal cases were 719, against 460 and 502 in the two previous quarters.

Compared with the numbers in recent corresponding quarters, the deaths referred to whooping-cough were below the average during the last quarter of 1873, being 1863, against 2956 and 2182 in the last three months of 1871 and 1872. In the eighteen large towns whooping-cough caused 907 deaths in the quarter, of which 605 occurred in London. The disease was also fatally prevalent in Kettering and Biggleswade.

Different forms of fever caused 3810 deaths in the quarter, against 4692 and 4023 in the two preceding corresponding quarters. This decline in the fatal prevalence of fever may be taken as evidence of sanitary progress. Fever invariably causes the greatest mortality in town populations, and was most excessive during this quarter in the manufacturing and mining population of Lancashire, the West Riding of Yorkshire, and Durham. Cambridge, Barrow-in-Furness, Market Weighton, Kirk Leatham, Durham, and Workington, among other places, suffered more or less severely from local outbreaks of fever.

The 3439 deaths from diarrhœa, the largest proportion of which occurred during October, differed but slightly from the numbers in recent corresponding quarters.

In the workhouses, hospitals, and lunatic asylums 11,020 deaths were recorded in the quarter, or 8·6 per cent. of the total deaths, corresponding with the proportion which prevailed in the fourth quarters of each of the two previous years. More than half these institution-deaths occurred in the eighteen large towns, among which the proportion to total deaths averaged 13·5 per cent., and ranged from 6·8 and 7·1 in Bradford and Sunderland, to 14·5 and 16·2 in Manchester and London. During the three months 6751 deaths, or 5·3 per cent., were registered upon the information of the coroner, being inquest cases; in the two previous corresponding quarters the inquest cases were 6423 and 6500. In the eighteen large towns the per-centage of inquest cases in the quarter averaged 6·5 per cent., and ranged from 3·5 and 3·7 in Bradford and Hull, to 8·6 and 8·8 per cent. respectively in Birmingham and Salford. To different forms of violence no less than 4233 deaths were referred in England and Wales, of which 1616 occurred in eighteen of the largest English towns; in these towns the proportion of deaths from violence to total deaths ranged from 2·2 per cent. in Bradford, to 6·4 per cent. in Liverpool.

LONDON.—The fatal prevalence of measles and the week of severe cold accompanied by dense fog in the early part of December unfavourably affected the health of the metropolitan population during the last three months of 1873; the annual rate of mortality during the 14 weeks ending 3rd January 1874 was equal to 25·3 per 1000, against 24·1, 25·8, and 19·8 in the corresponding periods of 1870–1–2. The London rate was, however, slightly below the average rate in 17 other large English towns having an aggregate population nearly equal to that of London. The deaths referred to the seven principal diseases of the zymotic class were 3256, of which measles caused 1420, whooping-cough 605, fever 539, diarrhœa 302, scarlet fever 283, diphtheria 90, and small-pox 17. These 3256 deaths were equal to an annual rate of 3·6 per 1000, whereas in the 17 other large towns this zymotic rate was 4·4 per 1000; but for the fatal

prevalence of measles this comparison would have been still more favourable to London. The fatal cases of measles in the Registration Division of London, which had been 120, 302, and 353 in the first three quarters of the year, further rose to 1420 during the last 14 weeks; the weekly numbers rose steadily from 32 in the 40th to 168 in the 51st week, and throughout November and December the disease was more fatally prevalent than it has been in London at any time since 1840. The 539 deaths referred to different forms of fever showed a further considerable increase upon the numbers returned in the two previous quarters; in the last quarters of 1871 and 1872 the deaths from fever were 548 and 318. The fatal cases of scarlet fever and diphtheria also showed an increase in the quarter, whereas those of whooping-cough and small-pox differed but slightly from the numbers in the third quarter of the year.

Diseases of the respiratory organs and phthisis caused 8623 deaths in London, against 5621 in the corresponding quarter of 1872; the annual rate of mortality from these diseases was equal to 9.6 per 1000, while the rate from the same diseases was 8.0 in Liverpool, and 6.8 in Birmingham. The weekly number of deaths from these diseases in London averaged rather less than 400 in the first three weeks of the quarter, whereas they rose to 1112 in the twelfth week, under the influence of the week of low temperature and fog in the early part of December.

In the public institutions of the Metropolis 3691 deaths were recorded in the quarter, equal to 16.2 per cent. of the total deaths; of these, 2109, or 9.3 per cent., occurred in Workhouses, and 1457, or 6.4 per cent., in Hospitals. A considerable proportion of the deaths in the Metropolitan Hospitals occur among patients admitted to those institutions from districts situated outside the registration boundaries of London; these deaths, however, are probably more than balanced by those of domestic servants and others, who, counted as residents of the Metropolis, return to rural homes when taken ill, and whose deaths, due in some measure to the evil effects of town residence, are registered in country districts. On this account no correction is made in the death-rate for deaths in the London Hospitals of persons not inhabitants of London; in many of the returns from foreign cities, however, this correction is made by the local authorities, without the addition of the deaths of town residents which occur outside the cities, thus reducing the calculated mortality.

The violent deaths in London were 771 in the quarter, of which 657 were the result of accident or negligence, 77 of suicide, and 22 of murder or manslaughter, including infanticide. The deaths of 53 persons were directly referred to accidents caused by horses or vehicles in the streets; from this class of accidents 716 cases of injury or maiming came under the notice of the Police within the London registration area during the 14 weeks ending 3rd January 1874.

HEALTH OF FOREIGN CITIES.—The following facts relating to Indian or Foreign Cities are derived from official returns furnished by various authorities abroad:

In PARIS the deaths during the quarter were 10,292, and were at the annual rate of 22.3 per 1000; 240 deaths were caused by cholera during October and November. In BRUSSELS the number of persons married was 794, the births were 1549, and the deaths (excluding those of strangers, i.e., of persons not ordinarily resident within the city) 1041; giving rates of 17.2, 33.6, and 22.6 per 1000 respectively; an outbreak of typhoid fever occurred towards the end of the quarter, but the deaths from this disease have shown some decline since the expiration of the quarter. The deaths registered in BERLIN were 5205, and the annual death-rate was 25.2; 179 deaths were referred to cholera, and 166 to diphtheria. In VIENNA 3615 persons, exclusive of strangers, died during the quarter, and

the corresponding death-rate was 22·5; the deaths from small-pox, which had been 735, 286, and 163 in the first three quarters of 1873, rose in the quarter to 236; and in the last week of the year 41 deaths were registered from this disease, a higher number than in any week since March. The deaths from cholera were 193 against 2533 in the previous quarter; they declined from 46 in the week ending 18th October, to one in the week ending 22d November, since which date only one death has been reported. The deaths from typhus showed a considerable decrease from the numbers returned during the previous quarter. In ROME 820 persons were married, 1872 children born, and 1675 persons (excluding strangers) died; the respective rates were 13·4, 30·7, and 27·5; the deaths from fever, which in the first three quarters of 1873 had been 197, 215, and 320, declined in the fourth quarter to 274, equal, however, to an annual rate of 4·5 per 1000 persons living. In FLORENCE there were 752 persons married, 1705 births, and 1277 deaths (excluding those of strangers), giving rates of 18·1, 41·0, and 30·7 respectively; 175 deaths were referred to typhoid fever and diphtheria, showing an increase upon the numbers returned in recent quarters. The returns from TURIN show the number of persons married to have been 780, of births 1689, and of deaths (excluding those of strangers) 1355, and the respective rates were 14·7, 31·9, and 25·5 per 1000, 84 deaths were referred to fever, which was slightly less prevalent than in the two previous quarters. The 1615 deaths in Amsterdam were equal to an annual rate of 23·3, and the 486 deaths in the Hague to a rate of 21·0 per 1000. Returns received from Copenhagen show a total of 1073 deaths, the equivalent annual rate being 21·5.

In the thirteen weeks ending 30th December, 3658 deaths were registered in Bombay, giving a rate of 22·7 per 1000; 1285, or 35 per cent. of the total deaths, were referred to remittent fever, the annual death-rate from this disease being equal to 8·0 per 1000. In Calcutta 3368 deaths were returned in the thirteen weeks ending 27th December, the equivalent death-rate being 30·2; the deaths referred to different forms of fever amounted to 47 per cent. of the total deaths. The 3635 deaths in Madras during the thirteen weeks ending 12th December showed a rate of 36·7; 138 deaths were referred to small-pox.

In New York 6412 deaths were reported in the quarter, and the annual death-rate from all causes was equal to 25·7; no less than 458 were caused by diphtheria, against 186 and 316 in the two previous quarters; 286 deaths resulted from scarlet fever, against 204 in the preceding quarter. The 3030 deaths in Philadelphia were equal to a rate of 16·2 per 1000 annually; 117 deaths were referred to typhoid fever, against 78 and 92 in the two preceding quarters.

THE YEAR 1873.—In the United Kingdom 1,093,893 births and 666,914 deaths were registered during the year 1873; the birth-rate was 34·1 and the death-rate 20·8 per 1000 persons. The excess of births over deaths was 426,979; but the increase to the population thus occasioned was partly counterbalanced by the emigration (from ports at which emigration officers are stationed) of 226,133 persons of British origin, of whom 120,869 were English, 21,564 Scotch, and 83,700 Irish. Of these 226,133 emigrants, 166,461 sailed for the United States, 28,418 for British North America, 25,164 for the Australian Colonies, and 6090 for other destinations.

In England 829,778 births and 492,520 deaths were registered. The births were 3871, and the deaths 255 more than in 1872. The birth-rate was 35·7 and the death-rate 21·2 per 1000, these rates being respectively 0·4 above and 1·4 below the mean rates for the ten years 1863–72. During all the four quarters of the year the marriage-rates were considerably above the average for the ten preceding years.

The 492,520 deaths included those of 123,811 children under one year of age, and of 126,224 persons aged 60 years and upwards; the proportion of the latter was considerably above the average.

The seven principal zymotic diseases were fatal in 68,057 cases, against 88,652 in the previous year. The mortality from these seven diseases was at the rate of 2·9 per 1000 persons living, against 4·5, 4·6, and 3·8 respectively in the three years 1870-1-2. Of these 68,057 deaths, 2332 were caused by small-pox, 7141 by measles, 12,901 by scarlet fever, 2260 by diphtheria, 9039 by whooping-cough, 13,148 by different forms of fever, and 21,236 by diarrhoea. These numbers, derived from the Registrar's Quarterly Returns, are subject to revision when the causes of death in 1873 are finally classified. The subsidence of the small-pox epidemic was the principal cause of the diminished fatality of this class of diseases; the prevalence of scarlet fever and diphtheria, however, in the last quarter of the year caused the mortality from these two diseases to be greater than in 1872. Inquests were held upon the bodies of 26,100, or 5·3 per cent., of the persons whose deaths were registered during the year; and 16,425, or 3·3 per cent., were the victims of various forms of violence, either wilful, or arising from accident or negligence.

HEALTH OF LONDON AND OTHER LARGE CITIES IN 1873.*

LONDON.—The population of London within the tables of mortality is estimated for the middle of the year at *three million three hundred and fifty-six thousand and seventy-three*.

The London of the tables has an area of *one hundred and twenty-two* square miles; it extends down the Thames from Fulham to Woolwich, and climbs the hills to Hampstead on the north, Norwood on the south side of the dividing tidal river crossed by seventeen bridges† and partially fringed by a fine embankment. The mean elevation of the houses above Trinity high-water mark at the last determination was *thirteen* yards; but the elevation ranges from *four yards below* in Plumstead Marshes, to *one hundred and forty-three yards* in Hampstead *above* that mark. The hills are higher than the hills of Rome, the river at night reflecting thousands of lights eclipses the Tiber.

The average daily supply of water by eight companies is of 514,269 metric tons taken from the Thames above Teddington Lock, from the tributary Lea, and from deep wells. The daily water supply to houses has increased from 178 gallons in 1872 to 184 gallons in 1873. The supply is virtually a monopoly, and though not now in the hands of any municipal authority, but of companies who are necessarily guided by commercial considerations, has been greatly improved since it was shown in the returns that intermingled sewage impurities diffuse choleraic and other zymotic diseases in an extraordinary manner: the main intakes have been carried higher up the Thames, the filtration has been improved, and in some places the water is supplied on the constant system. Dr. Frankland shows in his excellent report that 648 out of 2525 miles of main are always charged; so that the chief obstacles to the general introduction of a constant supply, facilitating alike the extinction of fires and of disease, are the costly and stringent regulations of the companies. The water of the Thames had 21°, of the Lea 22°, of the Kent Company 29° of hardness. The water supplied by the Kent Company, obtained from deep wells in the chalk, is of a very constant temperature (12°·1 Cent.); it is always clear and transparent, so that by using the softening process, for years in operation in Canterbury and other places, this company might supply water perfectly suitable to all purposes. To the New River, the West Middlesex, and the East London Companies the analyst awards a just meed of praise for their effective filtrations.

The main system of sewers under the engineers of the London Board of Works is approaching completion; so that ere long very little of the sewage will find its way into the Thames within the inhabited area. The chief deficiencies to be supplied are better branch drains in direct communication with the dwellings; and the productive disposal of the sewage for agricultural purposes. The average amount of sewage water pumped into the Thames daily at Crossness and Barking was 555,102 metric tons, which, if skilfully applied, might cover thousands of acres with fertility. How this can be done is the great problem of the day, and must be attacked at once in London and in all the other towns of the kingdom. The flow of sewage is greatest in the first, least in the third quarter of the year.

* Reprinted from the "Annual Summary" for 1873.

† Of these bridges six are for railways. Another bridge is in the process of construction. There are besides, the Thames Tunnel and the Hungerford Bridge for foot passengers.

The smoke nuisance has been partially dealt with ; but it admits of further reduction by operating not only on the furnaces of manufactories but on the kitchen and other fires, where the stoking is far from being so skilful as it might be. Every family creates nuisances by which its neighbours suffer. The recent London fogs have shown, by concentrating it, how fatal foul smoke is to weak lungs.

The meteorological elements of the year were very evenly balanced ; the temperature, the dew-point, the humidity, the rainfall, not only deviated very little from the average of the year, but very little from the average of the respective seasons. The mean temperature of the air was $32^{\circ}\cdot 9$ in the coldest week (ending February 8th), $68^{\circ}\cdot 8$ in the hottest week (ending July 26th), and $48^{\circ}\cdot 9$ in the year. The lowest temperature by night was $22^{\circ}\cdot 1$, the highest temperature by day $88^{\circ}\cdot 7$. These extremes of temperature increased the deaths registered in the weeks following.

The annual rateable value of property in London is 20 millions ; but it is impossible to say what the income of the inhabitants amounts to : taken as a rough approximation at seven times the rateable value it would amount to 140 millions a year. In the year ended March 1869* the receipts from rates, exclusive of county rates, were 3,730,572*l.* ; including the levies for poor relief 1,509,922*l.*, for vestry expenditure 1,112,218*l.*, for City Corporation and Commission of Sewers 192,514*l.*, for Metropolitan Board of Works 417,305*l.*, for Metropolitan Police 481,744*l.* Besides these rates of a municipal character, the receipts of the 13 Gas Companies for gas rates in the year 1870 were 2,046,974*l.*, while the receipts of the 8 Water Companies for water rates were 991,564*l.*, making the levy of rates by these companies 3,038,538*l.* a year. The revenue of the Gas and Water Companies from all sources was $3\frac{1}{2}$ millions sterling ; the expenditure $2\frac{1}{6}$ millions ; the net profit 1,349,436*l.* The capital of the companies at the latest returns was 18,291,130*l.* ; on which the net profit of 1,349,436*l.* would pay $7\frac{4}{10}$ per cent. Now it is certain that London, with a complete and intelligent municipal organization, could have borrowed money at the rate of $3\frac{1}{2}$ or 4 per cent. ; and had any such organization existed, the gas and waterworks on a combined plan might have been produced for less than 18 millions sterling ; but even at 4 per cent. the capital returned could have been raised at a cost of 731,645*l.* a year, instead of 1,349,436*l.*, with which London is now oppressed : 617,793*l.* would have been free to devote to other purposes ; or a sum exceeding by 200,488*l.* the whole of the rate levied by the Metropolitan Board of Works for the sewers, embankment, and other public works.

Neither water nor gas companies paid such dividends at first as they do now, because the consumption of their products was limited ; but the time has arrived when not only water but gas in towns is recognized universally as a necessary of life ; and both should consequently be supplied by the municipal authorities, wherever, in the opinion of the rate-payers, their mayors and town councils can be trusted to manage the municipal business with as much integrity, intelligence, and zeal for the interests of their fellow townsmen, as the directors of gas and water companies display on behalf of the shareholders.

The great water and gas companies now supply even a wider area than the London within the weekly tables ; and it is evident that while the Lord Mayor on his small domain stood aloof, and the half-trusted vestries wanted intelligence to perceive or to endeavour to supply the new wants of the age, the field was left open to capitalists, who acquired under Acts of Parliament the legal right to levy taxes, of which they can only be deprived by equitable purchase, and by such sacrifices as might be made with ultimate advantage to the inhabitants.

* Board of Trade Miscellaneous Statistics, p. 244.

The people of London in the main gain their own livelihood, and sustain their own poor. How they gain their livelihood is shown to a considerable extent by the Census returns, of which an abstract is supplied. Agriculture, as may be anticipated, is scarcely represented even among the *Males*; but the members of all the professions abound, and amount with their immediate subordinates to 107,130: the commercial, carrying, and warehousing class consists of 211,118; but the class exceeding all the rest is the industrial, numbering 504,772 males under specific employments, without counting 108,379 adult males, including 65,326 general labourers whose occupations are less definite.

Of women there are 630,030 wives, daughters, and others engaged in household duties, or aiding their husbands and parents; and no less than 226,393 domestic servants! 4879 women are schoolmistresses, 11,191 teachers and governesses, 5272 bookbinders, 4360 artificial flower makers, 38,460 milliners or dressmakers, 14,780 tailoresses, 26,875 shirtmakers and seamstresses, 4699 shoe and bootmakers, 10,724 (sewing?) machine workers, 43,998 laundry women; 29,013 women are returned simply as gentlewomen, or annuitants.

The tables of the sexes, ages, and conjugal condition show that of 1,081,973 of the population in 1871 under 15 years of age, the number of males and females is nearly equal; that the number of husbands and wives is 1,128,409; and the number aged 15 and upwards, widowed or unmarried of both sexes, is 1,043,878.

The number of wives 15 and under 45 years of age amounted to 408,837, of widows of the same age to 34,565, of spinsters to 414,851. The wives bore 108,166 registered legitimate children in 1871; the spinsters and widows 4451 registered illegitimate children. As more than one in 4 of the wives bear children annually, the nursing and bringing up of children is a large and important part of their occupation.

Of the 1,081,973 children under 15 years of age, 413,404 were returned as scholars, 617,236 as of no occupation, leaving only 51,333 children of both sexes having specific occupations. This is remarkable. Taking the 309,658 children of 10 and under 15 we have this result: 164,743 were returned as scholars, 93,904 as of no specific occupation, and 51,011 under employments, 10,175 of them being messengers and errand boys. It is evident that a larger number of the unemployed of both sexes should have been at school. Contrast this with Lancashire: there, out of 301,124 children of the age 10—15, no less than 116,564 were employed (59,536 in the cotton manufacture), 142,971 were scholars, and 41,589 were unemployed.

There are no complete returns, such as exist in Paris, of the amount of food consumed by the 3,356,073 inhabitants of London; but we know that it must be large; and that at the same time it comprises but a portion of the necessities and luxuries of life. The daily supply of food by river, canal, road, and railway is in itself a great operation: that is, however, intelligible; but there is an operation of still greater difficulty, and by no means so clear, which London accomplishes, and that is the production of the means of paying for its subsistence. London is self-sustaining; it lives neither on the tribute of the rest of the kingdom, nor on the spoils of provinces as did Rome, its ancient competitor in greatness. The Empire-city, in the words of Mommsen "had to be fed by its subjects;" and 320,000 of its citizens habitually received their dole of bread-corn free, until Cæsar reduced the numbers, by excluding all having means or otherwise provided for, to 150,000. And out of an estimated population of 2,045,000, full 800,000 slaves served the citizens gratuitously in arts, trades, and professions.*

* See Mommsen's *Rome*, English translation, Book V., Chap. xi., and Smith's *Dictionary of Greek and Roman Geography*; Article, *Rome*.

BIRTHS IN LONDON: INCREASE OF POPULATION.—The number of births during the year was 119,015, or 2281 weekly; and as the deaths were 75,459 or 1446 weekly, the excess of births over deaths was 44,466 or 835 weekly. This excess comes near the estimated increase of population, so the actual agrees with the natural increase; but there is a continual outflow of people born in London, and inflow of people born in the rest of the kingdom or abroad. In the census year London contained 1,198,684 persons born outside its limits; while upon the other hand 436,364 people born in London were located in other parts of England and Wales.*

The increase of London in the 10 years 1861-71 was at the rate of 16·1 per cent.; it was 23 per cent. in the West Districts, but all the increase occurred in Chelsea and Kensington, as the population declined in Westminster, and was stationary in the great district of St. George Hanover Square. The North Districts increased by 22 per cent.; but among them Marylebone declined, Pancras increased only 11, while Islington increased 38, Hackney 50, Hampstead 69 per cent. The population of all the Central Districts, extending from the Strand to the City of London, *decreased* 13 per cent. The law courts, railway stations, and offices have displaced dwelling houses; in the day time the offices are filled, but their occupants are properly enumerated at the houses in which they sleep, as there their families live, their children are born, their deaths are for the most part registered. The East Districts, with the exception of Bethnal Green, Mile End Old Town, and Poplar, were stationary or decreasing. The increase of population was greatest in South London, which, low and flat, has benefited so much by the new system of drainage, and lying near the Thames is convenient for many manufacturing processes. Lewisham, Camberwell, and Wandsworth, still thinly inhabited, increased 61, 56, and 78 per cent. in the 10 years preceding the Census.

The density of population in London was such, that there were 25 persons to an acre in 1841, and 42 in 1871; the density in the 30 years doubled in the West, North, and South Districts; in the Central Districts it declined from 172 to 150.

HEALTH OF LONDON: MORTALITY.—The mortality was at the annual rate of 24·2 per 1000 over the 34 years 1840-73; it was as high as 30·1 in 1849, 29·4 in 1854, and 26·5 in 1866, when cholera was epidemic: it was as low as 21·5 in 1872; 22·5 in 1873; the mortality having never been so low for any two consecutive years since 1840, and by fair inference never so low in any two years since London existed. It is a general law that the mortality increases with the density; and this would no doubt have been observed in London, had it not been for the increased purity of the water supply, the new system of drainage which is now, though incomplete, in operation, and some improvement in that most important condition of life—lodging.†

In the last year measles, whooping-cough, and diarrhœa were the ruling zymotic diseases. Fever in its three forms is less fatal than it was in former years; in 1862-65 its victims ranged from 2892 to 3689. In 1873 the deaths by fever were 1549, namely, 284 by typhus, 921 by typhoid or enteric, and 344 by simple continued fever.

The violent deaths show no diminution; they have progressively risen from 2247 in 1861 to 2843 in 1873. There is little increase of homicide or suicide; and a decrease of executions. While one execution excites great feeling, and a murder finds ample reports in the journals, it is left for weekly tables to tell that on an average 45 people of both sexes and

* Census Report, p. xxii., and p. 70.

† See Memorial of the Royal College of Physicians of London to the Right Hon. B. Disraeli.

of all ages are killed by negligence or accident every week in London. The deaths by violence in the streets in five years were 1028. Of this number, 50 deaths were caused in one way or other by horses; 55 by carriages; 94 by omnibuses; 130 by cabs. But these lighter carriages are far outdone by heavy vehicles, often driven unskilfully and without effective breaks; thus 353 persons were killed by vans and wagons; 26 by drays, and 289 by butchers', bakers', and other carts. Goods must be transported from one part of London to another; but the deaths under the car of Juggernaut sink into insignificance by the side of the deaths by vans, wagons, and carts in our own streets. In the last year the tram-carriages killed 17, against 12 killed by omnibuses; they evidently require careful drivers and conductors.

Measles is one of the important zymotic diseases which generally attack children once in their lifetime, and that generally at the ages 0-4. Its activity depends upon circumstances that have not yet been determined. It is therefore all the more important to record, and compare the facts that throw light on the courses of its zymotic development and subsidence.

The mean annual deaths by measles in the 34 years 1840-73 were 1487; seven-times the annual deaths exceeded 2000; and three times they fell below 900. The 52 weeks of 1864 saw 2750 deaths, the highest number; while the 52 weeks of 1852 saw only 600 deaths: the proportions being between 4 and 5 to 1.

Taking weeks, the weekly average was 29; in the cold months of January, February, March the weekly deaths by measles were 25; in the three warm months of July, August, September the weekly deaths were also 25; in the spring quarter they were 30; and in the last quarter of the year 34. This lends no support to the popular medical notion that under this disease cold is more injurious to patients than hot or intermediate temperatures. The seventh week of the year presented the lowest weekly average (20); the fifty-first the highest (43). Deaths from measles were registered in every week of the 34 years; but in one week of each of the years 1841, 1846, 1852, and 1861 only 2 deaths were recorded. On the thirty-first week of 1864 the deaths (102) exceeded 100; but this occurred only once again on any other week up to the forty-fourth of 1873, when the deaths by measles rose to 103; on the forty-seventh week they rose again to 130, and on the fifty-first week to 168. This is therefore the greatest number of deaths by measles in any one week since the year 1840.

THE LONDON OUTER RING.—The area of the outer ring is almost five times as extensive as the central city; and it extends over a circle drawn with a radius of 15 miles from Charing Cross. The population

of the greater London within the circuit is estimated at 4,050,577. Of this population 694,504 belong by estimate to the outer ring.

The social condition of the population outside is different from that of the London of the tables; but the difference in the rates of mortality is chiefly due to the difference of density.

The London water companies and gas companies extend their supply into, and not over the outer ring; but the great drainage system was, it appears, not designed for any Districts outside the jurisdiction of the Metropolitan Board of Works; so as the land becomes covered with population, and, as time flows on, saturated with impurities, the deficiency of drainage will tell seriously on the health of the inhabitants.

The outer ring having no connection with the Metropolitan Board is governed by vestries, and by the *thirty-two* following Sanitary Authorities: Epsom, Croydon, Wimbledon, Kingston, Ham, Surbiton, Malden, East Molesey, Hampton-wick, Teddington, and Richmond, in Surrey; Bromley, in Kent; West Ham, Wanstead, Leyton, Walthamstow, and Woodford, in Essex; Staines, Uxbridge, Twickenham, Ealing, Chiswick, Acton, Harrow-on-the-Hill, Hornsey, South Hornsey, Tottenham, Edmonton, Enfield, Waltham Holy Cross, and Cheshunt, in Middlesex; Barnet in Hertfordshire. Croydon has its own water supply, and an efficient system of drainage, under which it distributes the sewage on farms, which pay a high rental. Efforts in that direction are made by the other Local Boards; but upon the whole these smaller bodies appear to be incapable of dealing effectually with the vast problem which is every year increasing in complexity, and which requires immediate solution. Drainage, water supply, lighting, roads, sanitary arrangements of every kind can only be dealt with effectually by concentrated municipal power armed with adequate authority.

THE EIGHTEEN GREAT ENGLISH TOWNS AND CITIES.—The mortality in the whole population estimated at 6,485,894 was at the annual rate of 24 per 1000. Arranged in the order of mortality the towns stand thus: Portsmouth 18; Norwich 22; London 23; Sunderland 23; Bristol 23; Nottingham 23; Hull 24; Leicester 24; Bradford 25; Birmingham 25; Wolverhampton 25; Oldham and Sheffield 26; Liverpool 26; Leeds 28; Salford 29; Manchester and Newcastle-on-Tyne 30.

THE FIFTY LARGE TOWN DISTRICTS.—Their population is estimated at 2,626,363; and the births registered in the year were 96,317, the deaths 59,803; the excess of births over deaths was 36,514. The birth-rate was 37, the death-rate was 23 in 1000 living.

The mortality was below 18 per 1000 in Dover, Maidstone, and Cheltenham; below 19 in Hastings, Brighton, Reading, Cambridge, Colchester, and Devonport.

The mortality exceeded 30 in Blackburn and Preston; it was, as usual, high in all the Lancashire towns, which have yet a great deal to do ere their inhabitants can enjoy the average health of Englishmen.

REMARKS ON THE METEOROLOGY OF 1873.

By JAMES GLAISHER, Esq., F.R.S., &c.

Atmospheric Pressure.—The readings of the barometer about London, at the level of the sea, was on January 1st, 29·8 in., it increased to 30·16 in. by the 7th; decreased to 29·64 in. by the 9th, was 30·2 in. on the 14th; on the 16th a rapid decrease set in and continued to the 20th, when the lowest reading in the year took place, viz. 28·46 in.; it then turned to increase, and passed the point 30 in. on the 25th, and was about 30·1 in. till the end of January; a decrease set in on February 2nd, and on the 3rd the reading was 29·3 in.; from the 3rd the readings increased, and the point 30 in. was passed on the morning of the 5th, and 30·79 in. was reached on the 18th, this being the highest reading in the year; it then decreased, passing below 30 in. on the 21st, to 29·17 in. on March 1st, from this day to the 26th, the readings were mostly below 30 in., on the 6th and 8th being as low as 29·3 in. and 29·2 in.; from March 26th to the middle of July there was nothing remarkable in the variation of atmospheric pressure, the readings were alternately a little above and a little below their averages for a few days together; the extreme readings were 30·41 in. on May 29th, and 29·39 in. on July 9th. From the middle of July to the middle of August the changes were very small, and all readings were about 30 in.; from the middle of August the readings were below 30 in. to September 2nd; on September 4th the reading was 30·12 in., it decreased to 29·26 in. by the 15th, and increased to 30·54 in. by the 22nd, this being the highest point reached since February 20th. From September 22nd the readings generally decreased to 29·58 in. by October 7th, and after this time they generally increased to 30·52 in. on October 28th. There was then a rapid decrease to 29·13 in. by November 1st, this being a point lower than any since January 24th. From November 1st the reading generally increased, and was 30·48 in. on November 17th; the readings decreased to 29·39 in. by the 22nd, were generally low to the 29th, when 29·57 in. was recorded; a rapid increase then set in, and from December 1st to the 12th the readings remained exceptionally high and steady, and about 30·6 in.; on the 16th the reading was 29·87 in., but increased to 30·22 in. by the 18th, and was about 30 in. till towards the end of the year.

Temperature.—The warm period which set in on December 9th, 1872, continued without interruption till 19th of January 1873, the excess of temperature above their averages on some days exceeding 13°, and for the period (1st to 19th of January) the mean excess of daily temperature was 10°. On the 25th of January a cold period set in, and continued throughout February, the average defect of daily temperature for the period between 25th January and 1st March being 4°; this was succeeded by a week's warm weather, and the excess of daily temperature from 2nd to 9th of March being 3½° nearly; a fortnight's cold weather followed, the average defect of temperature being 3¼° daily. The warm weather which set in a week previous to the close of the preceding month continued till the 5th day of April, the mean excess of temperatures above their averages being 3¼° daily, from the 6th to the 13th the weather was very cold, the wind was mostly N.E., and the depression of temperature below the average was 3¼° daily. From the 22nd of April a long cold period set in, and continued below the seasonable average till the 18th day of June, for this long period of 57 days the deficiency of mean temperature was on the average 2¼° daily. Till the 19th of July the weather was cold, and the mean daily temperatures were below their averages by ¾°. On 20th July a sudden change took place, and for a few days, the weather was fine and hot,

immediately following those few warm days beginning 20th July, the weather was again cold, and from 20th July to 2nd September the weather was changeable, being characterised by several days of warm weather, followed by a few days of cold, and then succeeded by several warm days again; the warm days were, however, more numerous, and upon the whole period there was an excess of temperature averaging $2\frac{1}{2}^{\circ}$ on the 45 days ending 2nd of September. From 3rd of September to the end of the month the weather was cold, and the deficiency averaged 2° . From the 7th to the 12th of October the mean temperature was above and below its average alternately. A lengthened cold period set in of more than a month's duration, extending from 12th of October to 16th of November, and the average daily deficiency of mean temperature was $3\frac{1}{2}^{\circ}$, then from 17th of November to 7th of December the weather was mostly warm, and the excess of daily mean temperature was $3^{\circ}\cdot 1$. The mean excess of daily temperature above their averages for the last 17 days of the year was as large as $4\frac{1}{2}^{\circ}$.

Thus January was warm, February was very cold, and low temperatures generally prevailed till the end of May; the months of June, July, August, and September were slightly in excess of their average temperatures; September and October a little below, and November and December a little above their averages.

The temperature rose to $88\frac{3}{4}^{\circ}$ in July, and was $22^{\circ}\cdot 1$ on 10th of December, a day remarkable for its low temperature all over the country, and the middle of three days of extreme low temperatures, and these days in London were distinguished by the presence of a remarkably dense fog, darker in colour, and more dense than I had ever known a fog or cloud to be.

Rain-fall.—Was above its average in the month of January by $0\cdot 56$ in., February by $0\cdot 40$ in., June by $0\cdot 57$ in., August by $0\cdot 82$ in., September by $0\cdot 09$ in., and November by $0\cdot 27$ in.; it was below the average in March by $0\cdot 24$ in., April by $1\cdot 08$ in., May by $0\cdot 60$ in., July by $0\cdot 70$ in., October by $0\cdot 22$ in., and in December by $1\cdot 67$ in. The fall of rain in the year was $23\cdot 36$ in. or $1\cdot 80$ in. below the average annual fall.

The total fall of rain in the year at our stations ranged from $47\cdot 02$ in. at Stonyhurst on 286 days, to $18\cdot 61$ in. at Somerleyton Rectory on 161 days.

PRELIMINARY TABLES.

TABLE 1.—Estimated Population, and Number of Marriages, Births, and Deaths registered in England in each of the Thirty-six Years 1838-73.

YEARS ended Dec. 31st	Estimated POPULATION in ENGLAND in the Middle of each Year.*	MARRIAGES.	PERSONS MARRIED.	BIRTHS (exclusive of Still-born).	DEATHS	EXCESS OF BIRTHS OVER DEATHS.
1838	15,287,899	118,087	236,134	463,787	342,760	121,027

Mean in 36 years	16'5	33'9	22'5	61	30	45

NOTE.—The Table may be read thus:—In the year 1838 to every 10,000 persons living there were 154 persons married, 332 births, and 224 deaths; the number of persons living to every person married, birth or death, was 65, 33, and 45 respectively. The rates in this Table have been calculated upon the estimated populations given in Table 62, but no corrections have been made for the difference between an ordinary year of 365 days and leap year.

TABLE 3.—Marriages in England in each of the Thirty-three Years 1841-73; those solemnized according to, and not according to, the Rites of the Established Church; with other details respecting the Marriages in the Churches of the Established Church.

YEARS ended 31st December	TOTAL MARRIAGES.*	ACCORDING TO THE RITES OF THE ESTABLISHED CHURCH.						NOT ACCORDING TO THE RITES OF THE ESTABLISHED CHURCH.					
		Special Licence.	Licence.	Banns.	Superintendent Registrar's Certificate.	Not stated.	TOTAL IN ESTABLISHED CHURCH.	TOTAL NOT IN ESTABLISHED CHURCH.	In Registered Places. * Roman Catholics.	Other Christian Denominations.	Superintendent Registrar's Office.	Quakers.	Jews.

Mean Annual Rate per 1000 in each quarter during the 36 years					13·7	16·8	15·9	19·6

Note.—The three months January, February, and March contain 90 days, and in leap year 91 days; the three months April, May, and June 91 days and each of the last two quarters of the year 92 days. For this inequality a correction has been made in the above calculations.

* These rates may thus be read without reference to the decimal points :—In the March quarter of 1838, to 10,000 persons living, 124 persons were married.

TABLE 6.—Marriages in England. The Proportion per Cent. of **Minors** of each Sex, of Males and Females who signed the Register with Marks, and of Persons who were **Widowers** or **Widows**, in each of the Thirty-three Years 1841-73.

Mean Annual Rate per 1000 in each Quarter during the 36 years					35·5	35·1	32·6	32·4

* These rates may thus be read without reference to the decimal points:—In the March quarter of 1838, to 70,000 persons living 303 births were registered. In the calculation of these rates a correction has been made for the varying number of days in the different quarters, see note to Table 5.

TABLE 16.—Proportional Number of Births in England in each Quarter to 1000 Births in the Average Quarter* of each of the Thirty-six Years 1838-73.

1873 -	11,371,273	11,985,141	22·4	19·8	107	113
Average proportion in 36 years, 1838-73 -			23·3	21·4	104	109

The Table may be read thus:—In the year 1838 to every 1000 males living there were 23·4 deaths to every 1000 females living there were 21·5 deaths and to each 100 females who died there were 105 deaths of males. The last column shows the relative mortality of males and females; and that out of equal numbers living the deaths of males were as 100 to every 100 deaths of females in 1838.

TABLE 19.—Deaths of 89 Persons RETURNED as Aged 100 Years and upwards in ENGLAND and WALES during the Year 1873.

District Numb.	DISTRICT.	DATE OF DEATH.	PLACE OF DEATH.	SEX.	STATED AGE.	OCCUPATION.	CAUSE OF DEATH.

Mean Annual Rate per 1000 in each Quarter during the 36 years					24·9	22·0	20·6	21·9

* These rates may thus be read, without reference to the decimal points:—In the March quarter of the year 1838, to 10,000 of the population 262 deaths were registered. A correction has been made in the calculations for the inequality in the number of days in the different quarters, see note to Table 5.

TABLE 29.—Proportional Number of Deaths in England in each Quarter to 1000 Deaths in the Average Quarter* of each of the Thirty-six Years 1838-73.

YEARS.	NUMBER OF DEATHS IN THE AVERAGE QUARTER.	PROPORTIONAL NUMBER OF DEATHS				
		In the AVERAGE QUARTER (assumed to be 1000).	FIRST QUARTER ending March 31.	SECOND QUARTER ending June 30.	THIRD QUARTER ending Sept. 30.	FOURTH QUARTER ending Dec. 31.

Swansea - - - - M -	71,032	3073	1674	43.3	23.6	4.0	{ St. Cuthbert & St. Mary Sub-districts.

NOTE.—The letter M or P affixed to the name of each Town denotes whether the limits, which the District or Sub-districts in the last column approximately represent, are Municipal or Parliamentary.
The figures in this column are the numbers enumerated at the Census in April 1871, raised to the middle of 1873 by the addition of one the annual rate of increase which prevailed between 1861 and 1871. A decrease of population between 1861 and 1871 was shown in part, Devonport, Dudley, Coventry, Macclesfield, and Ashton-under-Lyne; in these instances the enumerated population has been proportionally depressed on the same principle.
The rates of mortality for these towns have been corrected by the exclusion of a proportional number of deaths occurring in County Asylums and Lunatic Asylums, situate within the Districts or sub-districts here taken as representing the towns, or by the exclusion of a proportion of the deaths in Union Workhouses in cases where a portion of the Union only is embraced by the area taken; where the Workhouse is situated outside that area.

TABLE 36.—Population; Persons to an Acre; Births and Deaths; Annual Birth and Death Rates; Mean Temperature and Rainfall, in the Year 1873, in LONDON and TWENTY other LARGE TOWNS of the UNITED KINGDOM.

CITIES AND BOROUGHES.	ESTI- MATED POPU- LATION in the middle of the Year 1873.*	PER SONS to an Acre, mid. 1873.	BIRTHS in 53 Weeks ending 3rd Jan. 1874.	DEATHS in 53 Weeks ending 3rd Jan. 1874. NOTE.—The deaths in Manchester and Bristol include paupers belonging to those cities who died in Workhouses situated outside the Municipal boundaries.

* The figures in this column, excepting those for Dublin, are the numbers enumerated at the Census in April 1871, raised to the middle of 1873 by the addition of 2½ times the annual rate of increase which prevailed between 1861 and 1871. The population of Dublin is taken as stationary at the number enumerated in 1871.

TABLE 37.—LONDON.—Deaths in Public Institutions in the 52 or 53 Weeks of each of the Thirteen Years 1861-73.*

* This Table is compiled from the Weekly Returns made by the Registrars of London, and relates to the 52 or 53 weeks of each year. The figures for 1873 will not agree with those given on page 100, which relate to the correct year instead of the 53 weeks; moreover, the same Institutions are not in all cases included in each list.

Average Number living } to One Death annually } (1840-73)	41	44	44	40	39	41

NOTE.—The populations upon which these rates of mortality have been calculated are deduced from the numbers enumerated at the four Censuses of 1841, 1851, 1861, and 1871. The deaths used are those registered in the complete years.

Certain alterations affecting the West and Central groups of districts were made in the year 1868, but corrections have not been made in the results given in this Table for years prior to 1861.

NOTE.—The numbers for 1837 were registered in the half year ending 31st December.

TABLE 45.—Area, estimated Population, and Marriages, Births, and Deaths registered in the United Kingdom, in the Year 1873.

	AREA IN STATUTE ACRES.	AREA IN HECTARES.	Estimated POPULATION in the middle of the Year 1873.	MARRIAGES.	PERSONS MARRIED.	BIRTHS.	DEATHS.
UNITED KINGDOM	77,634,301	31,416,757	32,134,598	268,075	516,150	1,093,363	606,914
Great Britain - -	56,512,354	22,961,226	26,787,337	232,945	464,690	949,516	566,377
England and Wales -	37,319,221	15,103,008	23,356,414	205,615	411,230	839,778	492,530
Scotland - - -	19,496,133	7,869,530	3,430,923	26,730	53,460	119,738	76,837
Ireland * - - -	30,810,947	8,425,329	5,337,361	25,790	51,460	144,377	97,537

* On the authority of the Registrar General of Ireland it may be assumed that the numbers of marriages, births, and deaths, in that part of the United Kingdom are understated through defective registration.

TABLE 46.—Proportion per 1000 of Marriages, Births, and Deaths to the Population of the United Kingdom, in the Year 1873.

	ACRES TO A PERSON.	HECTARES TO A PERSON.	TO 1000 PERSONS LIVING.			
			MARRIAGES.	PERSONS MARRIED.	BIRTHS.	DEATHS.
UNITED KINGDOM - -	2'42	'978	8'03	16'1	34'1	20'8
Great Britain - - -	2'12	'858	8'67	17'3	35'4	21'3
England and Wales - -	1'60	'647	8'60	17'6	35'5	21'1
Scotland - - - - -	5'68	2'300	7'79	15'6	34'9	22'4
Ireland - - - - -	3'00	1'579	4'82	9'6	27'1	18'3

Note.—The total area of a country, divided by its population, gives the average area to each person. The reciprocal gives the "density" of the population, or the population to each acre, square mile, or other measure.

TABLE 47.—Population, Area, Births, and Deaths in the Islands in the British Seas in the Twenty-three Years 1851-1873.

YEARS.	ISLANDS IN THE BRITISH SEAS.		ISLE OF MAN.		ISLAND OF JERSEY.		GUERNSEY AND ADJACENT ISLANDS.

* The deaths of soldiers, marines, and seamen from the Royal Navy, who were passengers in British Merchant Ships, were 83 in 1856, 89 in 1857, 150 in 1858, 196 in 1859, 196 in 1860, 69 in 1861, 122 in 1862, 116 in 1863, 96 in 1864, 140 in 1865, 154 in 1866, 97 in 1867, 81 in 1868, 51 in 1869, 27 in 1870, 24 in 1871, 1 in 1872, and 6 in 1873. The number is 1,634 in eighteen years, which, if added to the 10,641 above, makes 12,275, the total number of deaths of British subjects at sea in 1856-73, exclusive of those of merchant seamen. The Entries in the "Marine Register" of Births occurring in 1873 were but 80, and of Deaths 245.

In the 22 years 1852-73	4,046,584	86,906	21·4

* Deduced from a return of the number of accounts of wages and effects of seamen (exclusive of masters) dying before the termination of the voyage, received by the Registrar General of Shipping and Seamen. Since 1867 the return includes seamen dying ashore in foreign parts, whose wages and effects are delivered to the consuls or officers of the hospitals on their discharge from their ships.

If a seaman die on the passage from Sunderland to Calcutta, his death is reported at Calcutta, and his wages and effects are accounted for and transmitted home, if the vessel be not to return direct to the United Kingdom. But if a passenger die on board a ship which does not return to a British port immediately, but trades for a time in foreign parts, considerable delay may occur before his death is reported. In all cases, however, the date is given, and in the accompanying tables the births and deaths are classed according to the years in which they occurred. In some passenger-ships women are employed as stewardesses, and are counted as part of the crew. They therefore form part of the strength in this Table, and if the death of a stewardess occur in the course of a voyage, it is included in the column of Deaths.

When a ship is lost with all persons on board, the owners return the number and names of the crew, and the names of the passengers, when known, to the Registrar General of Shipping and Seamen.

TABLE 61.—RETURN of the AGES, RATING, and CAUSES of DEATHS of 5,393 Seamen reported to the BOARD OF TRADE as having died in the British Merchant Service in the Year 1873. (*Parliamentary Return, No. 142, Session of 1874.*)

TABLE 63.

ESTIMATED POPULATION OF THE UNITED KINGDOM,
(including ISLANDS in the BRITISH SEAS)
with Army, Navy, and Merchant Seamen abroad belonging thereto.*

Middle of the Census Years.	PERSONS.	MALES.	FEMALES.
1801 -	16,302,410	8,096,082	8,206,328
1811 -	18,532,522	9,194,348	9,338,174
1821 -	21,300,573	10,519,256	10,781,317
1831 -	24,423,588	12,004,025	12,419,563
1841 -	27,077,095	13,325,889	13,751,206
1851 -	27,764,034	13,656,998	14,107,036
1861 -	29,358,927	14,397,427	14,961,500
1871 -	31,914,985	15,622,725	16,292,260

* In estimating the number of men in the Army, Navy, and Merchant Service abroad, the proportion belonging to foreign countries and the colonies has been excluded. In 1811 the troops and seamen were 640,500, but as this number included natives of colonies and foreign parts, only 502,536 were taken.

The above numbers have been deduced by adding to the estimated population of the United Kingdom, as given in Table 62, the enumerated population of the Islands in the British Seas, and the Army, Navy, and Merchant Service abroad (see p. vii. of Vol. I. Census of England and Wales, 1871).

NOTE.—Cholera is given as being chiefly the cause of the high rate of mortality in Denmark in 1853; in Sweden in 1855, 1857, and 1866; in Austria in 1866 and 1873; in Prussia in 1866; in the Netherlands in 1859 and 1866, where also small-pox prevailed in 1871; and in France in 1865 and 1866. War contributed to the same end in Denmark in 1860 and 1864; in Austria in 1866; in Prussia in 1866, 1870, and 1871; and in France in 1870 and 1871.

TABLE 66.—England and Wales. Population; Number, and Proportion per 1000, of Persons Married, Births, and Deaths, in each of the Years 1853 to 1873.

M. V. Falbe-Hansen remarks that an addition of territory containing a population of about 8000 was made in 1864, and the facts relating to these are shown in this Table from 1860.

* The populations for these years were enumerated at the respective Censuses.

† Cholera was epidemic in the year 1853, and was raged in the years 1850 and 1864.

NOTE.—Previous to 1st January 1860 children who died within 24 hours after birth were counted as still-born.

TABLE 68.—Sweden. Population; Number, and Proportion per 1000, of Persons Married, Births, and Deaths, in each of the Years 1850 to 1873.

NOTE.—The Returns for Austria include Hungary, Croatia, Slavonia, and Transylvania from 1853 to 1862 inclusive; since 1863 the returns exclude those portions of the empire. Until 1864 the States of Italy were included; since 1864, however, they are excluded.

* Census years.

† Dr. Ficker attributed the excessive mortality in the year 1866 to Cholera and the war.

‡ Cholera caused the deaths of 107,007 persons in the year 1873.

NOTE.—The population in the 64 years 1863-65 and in the years 1867-69 was estimated by means of the average annual rate of increase observed between the two enumerations of 1861 and 1866. The returns since the year 1860 include the three newly annexed departments. The deaths of Frenchmen abroad, civil or military, are registered in the books of the Communes in which they were last domiciled.

* Census years.

† Cholera was prevalent in 1865-66, and war raged in 1870 and 1871.

1872*	—	—	—	—	—	—	—	—
1873*	—	—	—	—	—	—	—	—

NOTE.—The Population enumerated at the Census of 1860 was 15,973,536. The estimated Population for the Years subsequent to 1861 has been deduced from the Excess of Births over Deaths in each Year. The decline of registered marriages in 1870 is believed to be due to the introduction of civil registration, which occurred during that year.

* The figures relating to the three years 1871-73 are not available, owing to the disturbed state of the country.

The Registration Counties consist of groups of Superintendent Districts, which are generally co-extensive with the Unions. Those Districts which extend into two or more (proper) are included entirely in that County in which the principal town of the District, or the greater part of the District, is situated. The boundaries of Registration Counties

therefore differ more or less from the boundaries of Counties (proper).

† These figures have been furnished to the Registrar General by the Ordnance Survey Department. They do not include areas occupied by foreshore or tidal water of rivers and creeks.

* The Registration Counties consist of groups of Superintendent Registrar's Districts, which are generally co-extensive with the Poor Law Unions. Those Districts which extend into two or more Counties (proper) are included entirely in that County in which the principal town of the District, or the greater part of the population, is located. The boundaries of Registration Counties

therefore differ more or less from the boundaries of County (proper).

† These figures have been furnished to the Registrar General by the Ordnance Survey Department. They do not include space occupied by foreshore or tidal water of rivers and creeks.

of 6 and 7 Wm. IV. c. 86, in the Year ending December 31st, 1873.

are the parties to a marriage are of different religious
 less it sometimes happens that the ceremony is per-
 according to the rites of both persuasions: in these cases
 marriages are entered as two marriages. This column
 cases of marriage after divorce, viz., 26 divorced

men who married spinsters, 20 bachelors who married di-
 vorced women, 4 divorced men who married widows, 9 widowers
 who married divorced women, and 3 divorced men who married
 divorced women. For the districts in which these marriages
 took place, see Table 10, p. lxxv, of Report.

* The Registration Counties consist of groups of Superintendent Registrars' Districts, which are generally co-extensive with the Poor Law Unions. Those Districts which extend into two or more Counties (proper) are included entirely in that County in which the principal town of the District, or the greater part of the population, is located. The boundaries of the Registration Counties therefore differ more or less from the boundaries of the Counties (proper).

† These figures have been furnished to the Registrar General by the Ordnance Survey Department. They do not include space occupied by foreshore or tidal water of rivers and creeks.

‡ Some of the births—especially of illegitimate children in London and large towns—escape registration.

Abstract of Marriages, Births, and Deaths, 1873.

MARRIAGES, BIRTHS, and DEATHS registered in the Year 1873—continued.

* The Districts are collections of contiguous Parishes or Places combined for purposes connected with the Registration of Births, Deaths, and Marriages, and are nearly always identical with the Poor Law Unions of the same names; they are arranged according to their local position under the Registration Counties. The presence of Institutions in any District is indicated in this column of the Table by H for Hospital or Infirmary, L for Lunatic Asylum, and w for Workhouse Establishment receiving inmates from other Districts than the one in which it stands; and repetitions of these letters show the number of such Institutions in any District.

† Wherever the minus sign is prefixed to the number in the column headed "Excess of Births over Deaths," it denotes that the Births in the District, instead of exceeding the Deaths, were, in fact, less than the Deaths to the extent stated.

II.—SOUTH EASTERN COUNTIES.—MARRIAGES, BIRTHS, AND DEATHS, 1873—DISTRICTS—continued.

No.	DISTRICTS.	Area in Statute Acres.	POPULATION, 1871.	TOTAL			BIRTHS.				DEATHS.		Excess of Births over Deaths.	
				MARRIAGES.	BIRTHS.	DEATHS.	Including Illegitimate Births.		Illegitimate Births.	Males.	Females.	Males.	Females.

* The Sub-districts are sub-divisions of Districts, and comprise the Parishes or Places in which the Births and Deaths are registered by Registrars severally appointed for that purpose. The letter W denotes that the Sub-district contains within its limits a Workhouse Establishment belonging to the District or Union w indicates that a Workhouse Establishment receiving inmates from other Districts than the one in which it stands is included H indicates a Hospital or Infirmary L a Lunatic Asylum and repetitions of any of these letters show the number of such Institutions in each Registration Sub-district.

Wherever the minus sign is prefixed to the numbers given in the Column headed "Excess of Births over Deaths," it denotes that the Births in the Sub-district, instead of exceeding the Deaths, were, in fact, less than the Deaths to the extent stated. The Excess of Deaths over Births is often attributable to the mortality in Institutions. The Deaths in the principal Institutions of England in 1873 are given on pages 90-112.

DEATHS IN PUBLIC INSTITUTIONS,

1873.

THE FOLLOWING PAGES contain the numbers of deaths registered during 1873 in most of the public institutions of England. These figures will afford the means of correcting the mortality of districts and sub-districts where affected by the situation therein of these institutions, through the deaths recorded in them. The following list includes all Workhouses, Hospitals, Infirmarys, and public Lunatic Asylums, while prisons, almshouses, schools, private lunatic asylums and benevolent asylums, are excluded. The list, as settled, includes 1299 institutions; of which 720 are Workhouses, Workhouse Infirmarys, or Workhouse Schools; 500 Hospitals or Infirmarys; and 79 Lunatic Asylums. The Lunatic Asylums are mostly County Asylums, but a few private Asylums which receive pauper patients are also included.

Deaths registered in Public Institutions of England in the Year 1873.

NOTE.—The Table may be read thus: Of the 254,985 deaths of Males, 69,105 were those of children under 1 year of age; 19,505 those of the age 1 and under 2 years; 8,346 of the age 3 and under 4 years; 6,001 of the age 5 and under 10 years, and so on.

* This column includes the deaths of 10 males registered as aged 100 years and upwards; namely, 4 aged 100, 4 aged 101, 4 aged 102, and 1 aged 103 years. The districts in which these deaths occurred and the cause of death in each case are stated in Table 18, page LXXXIV, of Report.

The Causes of Death in England and in London, in combination with the Ages at Death, are given at pp. 144-150.

ENGLAND.—SUPPLEMENTARY TABLE of the

[The principles upon which the Causes of Death are tabled have been explained in previous Annual Reports. It will be sufficient to state now that all Diseases are classified in the Tables of Causes of Death, pp. 146-149, under 116 heads; some of these heads, however, include groups of diseases which are very distinct from one another, but which either are fatal to only a few persons, or are often confounded with other diseases. The rule has been to refer the distinct diseases to heads under which the cases were so numerous, that the additional numbers

TABLES (MISCELLANEOUS)	224
TABLE of CAUSES OF DEATH in ENGLAND 1866-73 as classified by a COMMITTEE appointed by the ROYAL COLLEGE OF PHYSICIANS OF LONDON	248

APPENDIX.

LETTER to the REGISTRAR GENERAL on the CAUSES of DEATH in
ENGLAND, by W. FARR, Esq., M.D., F.R.S.

YEAR 1873.

SIR,

THE year was less fatal than is usual. Taking population into account the seasons never since the year 1856 saw so few people die. Some of the most pernicious causes of death remained in abeyance, as I now proceed to show in a rapid survey of the facts recorded amply in the Tables.*

The total deaths were 492,520, of which the causes were specified sufficiently for classification in 485,735 instances. Of the cases unclassified 3346 were returned by the coroners and others as sudden or as from causes unascertained: of 3439 the causes were not specified.

I.—ZYMOTIC DISEASES.

The deaths from zymotic diseases were 89,286: making, after correction for unspecified cases, 38.50 per 10,000 of the population.† This is less by 12.36 than the average 50.86 of the twenty years 1850-69. Their mortality, somewhat above the mean in the two years 1870-1, fell in 1872, and again still more in the year 1873.

There are four orders in the zymotic class, and it is in the miasmatic order that the decline has been most sensible. Thus comparing the annual mortality per 10,000 of the twenty-years 1850-69 with that of 1873 the mortality by small-pox fell from 2.04 to 1.02; by measles from 4.37 to 3.19; scarlet fever and diphtheria from 10.46 to 6.76; croup from 2.54 to 1.85; whooping-cough from 5.21 to 4.14; fever in its three forms, in the first years undistinguished, fell from 9.18 to 5.85; dysentery from 0.76 to 0.31. Erysipelas and carbuncle declined. Ague and remittent fever, once so dangerous and causes of so much sickness in England, and still so fatal elsewhere, were fatal to very few lives in 1850-69, and to fewer still in 1873. Rheumatism is stationary. Neither influenza nor cholera was epidemic in 1873: the mortality per 10,000 these diseases occasioned was only 0.11 and 0.32: the actual deaths referred to influenza were 266, to cholera 749. In the years 1847-8-9 the deaths by influenza were 4881, 7963, and 1618; by cholera 783, 1908, and 53,273! By the progress of hygienic measures this country may hope to be spared, for the future, appalling visitations of cholera.

Enthetic diseases occur more frequently than they did some years ago. The deaths by syphilis were 1843: of that number 1470 were children under two years of age. 166 were males and 178 were females of 15

* Tables 1 to 16, pp. 224-247.

† It is convenient in dealing with mortality from classes of diseases, to give the rate per 10,000 to avoid too many decimals. By moving the decimal point one place to the left you have the rate per 1000.

Under the second order are arranged 2375 deaths in childbirth, exclusive of 1740 by puerperal fever. The deaths are shown for a series of years in Table 13, and are compared with the births of live-born children. It will be noticed with regret that the proportion of deaths of mothers to children implies a higher mortality than has occurred since the years 1864-5; 5 mothers died to 1000 children born alive.*

29,282 persons died of old age; 30,333 died of atrophy and debility, including 22,748 infants under one year of age.

V.—VIOLENT DEATHS.

The deaths of 17,246 persons were registered as caused by violence: in conformity generally with the finding of coroners' inquests, 15,106 of them by accidents, but many really from negligence; 407 by homicide; 1518 by suicide; 9 by execution.

Thus out of 10,000 people, the population of a small town, seven persons (7·44) were killed by obvious causes of various kinds.

Including infanticide, homicide, as defined at inquests, declined after 1865-69; but it increased from 387 in 1872 to 407 in 1873. The criminals convicted for murder were 18; for manslaughter 132.†

Executions have declined since the five years 1860-64 to 1873 from 8 to 4 in ten millions of population.

Suicide has been nearly stationary since the year 1860; the proportion of ascertained suicides to a population of 1,000,000 was 66·6 in 1860-4, 67·2 in the next five years; 70 in 1870, and 66 in each of the years 1871-2, and 65 in 1873.

What are called accidental deaths are often the result of negligence, wilfulness, or rashness. Thus of the 1543 suffocated, 1242 of them children under five years of age; 1145 of them babies in the first year of life, many might have been saved by obvious precautions. It is gratifying to notice a decline of the mortality by burns and scalds from 147 in 1860-4 to 98 in 1873. Further precautions in wearing unflammable dresses, providing escapes from conflagrations, will effect further reductions. The deaths by poisons show a decrease. They are chiefly from laudanum, solid opium, morphia, prussic acid, cyanide of potassium, strychnia, sulphuric acid, carbolic acid, salts of lead, arsenic, overdoses of medicine. Hydrate of chloral and chloroform are new medicines. Chloroform was the cause of 15 deaths; 10 of males, 5 of females.

Fatal doses of none of these poisons should be left about, or in the hands of patients. It is to be feared if this is not attended to, that they will kill more people than they cure. Poisons are not so often as they are believed to be, remedies. They are not all indispensable; and when administered in over-doses they may be fatal.

Registered deaths by drowning were 2695; this is exclusive of 3263 unregistered deaths at sea in the merchant service. Enough care is not yet bestowed on saving life from drowning. Happily the life-boat service is making some progress all round the coast, and by the Act of last session the lives of many seamen will be saved.

7221 deaths were ascribed to fractures and contusions, the direct effects of mechanical force variously applied. More of that force, as compared with the population, exists in England than in any other country; and this loss of life is one of its sad incidental effects. We have not kept pace with its development in guarding against its destructive effects. Let us hope that the multitude of these deaths, and of the innumerable injuries with which they are associated will lead to the discovery of remedies.

* See Tables 10, 11, 12.

† Judicial Statistics, 1873, p. 45.

The same science that creates engines of death may bring to light means of control and safety.

The violent deaths are carefully classified and analysed in the Table.* It will be seen that 1290 deaths were connected with railways, 990 with mines.

The 1290 deaths include those of railway servants. And it is worthy of remark that the number is very nearly the same as the number of deaths by horse conveyances of one kind or other. The deaths on railways may be considered as deaths additional to those incurred in the old conveyances, including wagons, carts, &c. of the country.

To the deaths by lightning the attention of physicists is especially directed. Their distribution over the several districts is given, and in every case the sex, age, and occupation are distinguished. The deaths in each year since 1868 were 11, 7, 19, 28, 46, 21; thus the electrical action of the earth measured by deaths from lightning increased rapidly from 1869, when only 7 persons were killed, to 1872, when 46 were killed by lightning. In the first three years 37, in the last three years 95, were killed.†

The Royal College of Physicians was good enough to appoint a Committee to revise the nomenclature of diseases, and to draw up a report thereon, and I have endeavoured, as far as was practicable, to give the Causes of Death classified according to their nomenclature for the eight years 1866-73, for the sake of comparison in the Table 17.‡

I have the honour to be,

Sir,

Your obedient servant,

WILLIAM FARR.

To
The Registrar General.

* See pp. 196-205.

† See Table, pp. 245-6.

NOTE.—For the causes of death in the 5 years 1858-62, see Table 7 in the Appendix to the Thirty-fourth Annual Report. The causes of death were not abstracted for the 4 years 1845-46.

* Order 2, comprising Violent Deaths in Battle is inapplicable to the civil population.

† The number of persons executed in the several years will not necessarily correspond with that returned for the same years in the "Criminal Returns," inasmuch as the executions recorded in each year are classed in the latter according to the dates of conviction, while the numbers in this Table are placed under the years in which the deaths are registered.

of the 27 Years 1847-1873.

* From 1847 to 1857, inclusive, premature birth and infantile debility were abstracted under one heading. In order, therefore, to establish something like uniformity in the above Table, the numbers against each of these separate headings have been estimated the proportions which the numbers under each bore to the sum of the two in subsequent years, when they were separately given. † See note on page 300.

England in each of the 27 Years 1847-1873.

* The rates given in this Table for the various groups of years are the means of the calculated rates in the several years. Under no the separate headings the means cannot be given for the entire period, as the classification in full detail has not been made during the 20 years. In a certain number of cases in each year the cause of death is not stated; in calculating the proportional numbers also these have been distributed pro rata over all the causes in the Table.

† Order 2, comprising Violent Deaths in Battle, is omitted, as inapplicable to the civil population.

Causes of Death in 1873.

TABLE 4.* (continued).—Mean Annual Rate of Mortality in England from each CLASS of CAUSE from each CAUSE of DEATH during the 20 Years 1850-69, and in each Decade and Quinquennium of that Period; also the Rate of Mortality in the Years 1870, 1871, 1872, and 1873.

* The populations of these counties have been estimated to the middle of 1873 on the assumption that the rate of increase or decrease which prevailed between the two census enumerations in 1861 and 1871 was maintained up to the middle of 1873; the county totals were then adjusted in order to cast to the estimated total population of England and Wales.

INDEX OF DISTRICTS.

[The following Index furnishes a reference to the *Number* of each REGISTRATION DISTRICT in the topographical arrangement adopted in the Tables of Abstracts contained in the Report. The alphabetical arrangement places compound names in the order in which they are pronounced: thus, East Ashford will be found under the letter E, and not under A.]

In consequence of numerous alterations (amalgamations of districts and formations of new districts) since the numerical arrangement, 1 to 623, was adopted in the Abstracts for the year 1847, the districts were re-numbered consecutively from 1 to 627 in the Abstracts for the year 1871.*

For names of Towns, such as Leamington, Torquay, &c., which are not found in this "Index of Districts," see the "Index of Sub-districts" (page 271) and "Index of certain Towns" (page 281).

A

Aberayron, 600.
Abergavenny, 579.
Aberystwith, 601.
Abingdon, 114.
Alcester, 398.

INDEX OF SUB-DISTRICTS.

This alphabetical arrangement places the Registration Sub-Districts (or Registrars' Districts) having *compounded names* in the order indicated by the usual pronunciation of those names; thus, East Grinstead will be found under the letter E, and not under G; St. James under the letter S, and not as "James, St." number against each Sub-District, in the third column, refers to its numerical place in the Tables Abstracts; thus, Abbey Holme (570; 2) is the 2d Sub-District of the Wigton District, No. 570.]

SUB-DISTRICT.	DISTRICT.	No.	SUB-DISTRICT.	DISTRICT.	No.	SUB-DISTRICT.	DISTRICT.	No.
A			Ardleigh . . .	Tendring . . .	194; 5	Baschurch . . .	Ellesmere . . .	354

TO

REGISTRAR-GENERAL'S THIRTY-SIXTH ANNUAL REPORT AND APPENDIX.

	PAGES
AGES ; of Persons married in 1873	viii-ix
Mean Age at Marriage	viii-ix
Deaths of Males and Females registered at different Ages in England in each of the Years 1838-73. (Tables 20, 21, pp. lxxxv, lxxxvi.)	xiv-xv
Mortality of Males and Females at different Ages in England in the Years 1838-73. (Tables 22-25, pp. lxxxvii-xc.)	xiv-xv
Mortality of Persons, Males and Females, at 12 groups of Ages in Divisions and Counties. (Tables 26, 27.)	xci-xcii
of 300,262 Persons married in 1873, distinguishing Bachelors, Spinners, Widowers, Widows	26-28
at Death of Males and Females registered in 1873 in Divisions, Counties, and Districts	120-141
at Death of Males and Females in England registered from different Causes, in 1873	144-149
at Death of Males and Females in England registered from different Supplemental Causes, in 1873	150-153
at Death of Males and Females in London registered from different Causes, in 1873	154-159
(See also MARRIAGES, BIRTHS, and DEATHS.)	
ALCOHOLISM. (See INTEMPERANCE and DELIRIUM TREMENS.)	
APPENDIX TABLES	224-265
AREA in Statute Acres of each Division, County, District, and Sub-district	30-84
of the Islands in the British Seas. (Table 47.)	cx
in Acres and Hectares of the United Kingdom in 1873. (Table 45.)	cix
ARMY ; Strength and Mortality of the Army at Home and Abroad. (Tables 51-58, pp. cxiv-cxvi.)	xix
Average Strength of the British Army at Home in 1873. (Table 51, p. cxiv.)	xix
Average Strength and Proportion per cent. of the British Army at Home and Abroad in each of the Years 1861-73. (Table 52, p. cxiv.)	
Mortality of the Army at Home in 1873. (Table 53, p. cxiv.)	xix
Average Strength of the British Army Abroad in each of the Years 1870-73. (Table 54.)	cxv
Number of Deaths in the British Army at Home and Abroad, 1870-73. (Table 55.)	cxv
Annual Rate of Mortality per 1000 amongst Officers and Men in the Army at Home and Abroad, 1858-73. (Table 56.)	cxv
Strength at Home and Abroad in 1861 and 1871, showing the Numbers and Proportion per cent. born in the different parts of the United Kingdom and elsewhere. (Table 57.)	cxvi
Deaths in Army Abroad of Officers and Men belonging to Great Britain and to England and Wales, 1858-73. (Table 58.)	cxvi

	PAGES
AUSTRIA; Average Annual Proportion to Population of Persons married, Births, and Deaths, 1853-73	xxii
Marriage, Birth, and Death Rates compared with those of other European States. (Table 65.)	cxxiii
Estimated Population; Number, and Proportion to Population, of Persons married, Births, and Deaths, in each of the Years 1853-73. (Table 69.)	cxxy
 BIRTHS in 1873	xi
out of Wedlock, proportions in Eleven Years, 1863-1873	xii
in quarter ending March 1873	xxvi-xxvii
in quarter ending June „	xxxiv
in quarter ending September „	xli-xlii
in quarter ending December „	xlix-l
registered in England, and excess over Deaths, in each Year, 1838-73. (Table 1.)	lxvi
Legitimate and Illegitimate in England in 1842 and in the Years 1845-73, and Proportion of Males to Females. (Table 11.)	lxxvi
proportion of Illegitimate Children to every 100 Births in the several Counties of England in each of the Years 1863-73. (Table 12.)	lxxvii
registered in England in each Quarter of the Years 1838-73. (Table 13.)	lxxviii
proportional Number of Births in each Quarter to 1,000 Births in the average Quarter of the Years 1838-73. (Table 14.)	lxxix
in Counties, in 1873. Numbers, Sex, Legitimate and Illegitimate; Proportions of Male to Female Births, Legitimate and Illegitimate; Proportion of Illegitimate Births to Total Births. (Table 15.)	lxxx
proportion of Male and Female Children born in the several Counties of England during each of the Years 1863-73. (Table 16.)	lxxxi
in Fifty large Town Districts in 1873. (Table 35.)	xcix
in Twenty-one large Towns of the United Kingdom in 1873. (Table 36.)	c
in London in the Years 1861-73, distinguishing Males and Females. (Table 39.)	cii
in the United Kingdom in 1873. (Table 45.)	cix
in the Islands of the British Seas in the Years 1851-73. (Table 47.)	cx
of British Subjects at Sea, in the Years 1856-73. (Table 59.)	cxvii
registered in each of the Divisions, Counties, Districts, and Sub-districts in 1873, distinguishing Males and Females and the Illegitimate	30-84
excess over Deaths in each of the Divisions, Counties, Districts, and Sub-districts in 1873	30-84
registered in the Divisions and Counties (distinguishing Males and Females) in each of the Four Quarters of 1873	86-89
of Children born out of Wedlock registered in the Divisions and Counties (distinguishing Males and Females) in each of the Four Quarters of 1873	90-93
in Foreign States. (See FOREIGN STATES.)	
illegitimate. (See ILLEGITIMATE BIRTHS.)	

	PAGES
BIRTH-RATE in England in 1873	xi
in England in each of the Years 1838-73. (Table 2.)	lxvii
in England in each Quarter of the Years 1838-73. (Table 13.) . .	lxxviii
in Counties in each of the Years 1863-73. (Table 17.)	lxxxii
in Fifty large Town Districts in 1873. (Table 35.)	xcix
in Twenty-one large Towns of the United Kingdom in 1873. (Table 36.)	c
in the United Kingdom in 1873. (Table 46.)	cix
in Foreign States. (<i>See FOREIGN STATES.</i>)	
BRAIN DISEASES; Fatality and Mortality	221
BRONCHITIS; Mortality from	221
rapid increase; Mortality in four Quinquennials, 1850-69, and in 1873	221
BURNS AND SCALDS. (<i>See VIOLENT DEATHS.</i>)	
 CAUSES of DEATH; of Seamen in the British Merchant Service in 1873. (Table 61.)	cxix
of Males and Females in England, at different Periods of Life, in 1873	144-149
(Supplementary Table) of Males and Females in England, at different Periods of Life, in 1873	150-153
of Males and Females in London at different Periods of Life, in 1873	154-159
of Males and Females in England, and in each of the Divisions and Counties, in 1873	160-183
(from certain zymotic and other Causes) in 1873, in the Divisions, Counties, and Districts of England	184-195
Dr. Farr's Letter to the Registrar General thereon	219-223
registered in England in each of the Years 1847-73. (Table 1.— App.)	224-229
rate of Mortality from, to a Million persons living in each of the Years 1858-73. (Table 2.—App.)	230-232
proportional Numbers dying from each Cause in 1873. (Table 3. —App.)	233
rate of Mortality from, during four periods of Five Years, two Decades, and in 1870, 1871, 1872, and 1873. (Table 4.— App.)	234-237
in England, in 1873, arranged in the order of their fatality. (Table 5.—App.)	238
of Persons, Males and Females, in each Year 1866-73, classified according to the nomenclature recommended by the Committee appointed by the Royal College of Physicians of London. (Table 17.—App.)	248-265
 CENTENARIANS; deaths of reputed. (Table 19.)	lxxxiv
 CHILDBIRTH; excessive number of Deaths from	222
Deaths in 1873, at different Ages, of Women after Childbearing, classed under various Diseases, and neither referred to Child- birth nor to Metria in the Abstracts. (Table 11.—App.)	243
Deaths of Women in 1873 who were returned as pregnant, classed under certain Diseases. (Table 12.—App.)	244
Deaths of Women from Metria and Childbirth in each of the 27 Years, 1847-73, and proportional Deaths of Mothers to Children born alive. (Table 13.—App.)	244

	PAGES
CONSOLS; average price of, 1852 to 1873. (Table 33.)	xcvii
CONSTITUTIONAL DISEASES	220
DEATHS in 1873	xiii
at different Ages	xiv
in Public Institutions	xvii-xviii
in the British Army at home and abroad	xix
in the Royal Navy	xix-xx
and State of the Public Health in quarter ending March 1873	xxviii-xxxix
in quarter ending June „	xxxv-xxxix

REPORT

TO

The Right Honourable GEORGE SCLATER-BOOTH, M.P.,
President of the Local Government Board, &c. &c.

*General Register Office, Somerset House,
31st July 1876.*

(1874.)

SIR,

I HAVE the honour to submit to you my Thirty-seventh Annual Report on the Registration of Births, Deaths, and Marriages in England.

This is the last year that registration has been carried on under the old Acts, and the results admit of strict comparison; my next Report will enable me to discuss the effect of the changes under the new measure, which you introduced in 1874 on the part of the Government, and which received Her Majesty's sanction.

Births, deaths, and marriages are so important,—connecting as they do, successive generations, and reflecting vividly the happiness or misery of families,—that they demand every year attention. It is not with these events a mere question of money, or of fluctuations of prosperity that come and go, but of life.

I have continued the publication of my Weekly and Quarterly Returns, which have proved of much use for administrative as well as scientific purposes. The weekly table appears on every Wednesday, and gives an ample analysis of the births and deaths and causes of death in the Metropolis during the previous week. I have added to it weekly returns for the Outer Ring of London, and for all the great cities of the United Kingdom.

The facts in the Quarterly Return are compiled rapidly by the Registrars, from their register books, and I am thus able to publish the number of births and deaths in each of the 2195 sub-districts of England and Wales within a month of the end of every quarter of the year.

The returns of marriages being made in part by the clergy of the Established Church, and not by my own officers, do not reach this office in time to enable me to do more than publish the number of weddings in the second quarter following their occurrence.

The weekly Table of Mortality is an old London institution, improved, I hope, if not perfected; and now its utility is very much increased by its

including corresponding returns from Calcutta, Bombay, and Madras, in our Indian Empire ; from Paris, Brussels, Amsterdam, Rotterdam, the Hague, Copenhagen, Stockholm, Christiania, Berlin, Hamburg, Breslau, Munich, Vienna, Buda-Pesth, Rome, Naples, Turin, and Florence, in Europe ; from Alexandria in Africa ; from New York, Brooklyn, Philadelphia, and Boston, in North America. The births and deaths, distinguishing deaths from the principal zymotic diseases, are sent to me, and published weekly. Thus observers, like watchmen on the walls, are ever on the look out, so that men see exactly what is going on, and neither plague, cholera, nor any other great epidemic can take the nations by surprise.

Statistics are cultivated in Russia, and I hope ere long to be able to add the capitals of that empire to the other cities whose authorities now co-operate in carrying out this great system of hygienic observation.

The doctrines of population were never more important than they are in the present day, and I trust that the series of facts in these reports will be of use to political students in enabling them to solve the problems in which this kingdom,—the mother of so many colonies,—is so deeply interested. The age at marriage in all cases, and the age of parents at the births of their children, appear now to be all that the English schedules want to meet the requirements of physiological and statistical science.

There can be no doubt that large sums of money have been expended here and there in recent years on sanitary works of various descriptions ; and the country naturally expects to see the fruits of the expenditure. Has the money been wisely expended, or has there been a failure either in the schemes of work, in the skill of engineers, or in the medical officers of health ? Have they not understood the highest truths of hygienic science as they were taught by Professor Parkes, whose loss the country has to deplore ? or have the municipal and other sanitary authorities not yet completed what they have undertaken ? What is certain is that the mortality of the whole population, though not so low as it is in some countries is much lower than it is in large empires. That the health of the people is not stronger is partially due to the increasing density of the population ; without corresponding arrangements for lodging them, for supplying them with pure water, for preventing the discharge of black smoke into the air they breathe, or for carrying away impurities to the earth to which they belong. This question has already been intelligently discussed by Dr. Buchanan ;* but I have thought it well, with the observations of thirty years before me, to inquire especially into the connexion between great reductions in the mortality and genuine sanitary works. The result is decisive ; there remains no question that the increased salubrity of several towns and districts is due to sanitary measures. Where no such effects follow improvements the improvement is only apparent, or the works are imperfect.

Considering the mining and manufacturing operations, the industries of every kind going on, and the aggregation of great numbers of people in cities, this greater London alone holding within 15 miles of Charing Cross more than four millions of people, the progress of the health of England since the seventeenth century when the great plague ravaged London is a source of congratulation. Much undoubtedly remains to be done. But the Medical Council is growing alive to the importance of the systematic study of State medicine. A body of Health Officers second to none in skill, and devoting themselves wholly to conservative medicine will be called into existence, by attractions as great in the counties and cities as

* See Report by Dr. Buchanan on the results which have hitherto been gained in various parts of England by works and regulations designed to promote the public health.—9th Report of the Medical Officer of the Privy Council, pp. 40-208.

private practice offers. If engineers, chemists, and agriculturists in the end solve the sewage and water questions satisfactorily; if dwellings are built and regulated so as to be noxious no longer in village, town, or city, the returns of Death—that impartial, inexorable inspector,—will bear testimony to the efficiency of all the Health Departments.

Increase of Population.—The returns published by the Marine Department of the Board of Trade show that the number of emigrants, who left the United Kingdom in 1874 for places out of Europe was 241,014 or 69,598 less than in 1873.

An attempt has been made to distinguish *bonâ fide* settlers from passengers, but it has hitherto proved unsuccessful.

The annexed Table shows the nationality of the emigrants from the Ports of the United Kingdom during the last twelve years :—

YEARS.	English.	Scotch.	Irish.	Foreigners.	Not distinguished.	Total.
1863	61,243	15,230	116,391	7,833	23,061	223,758
1864	56,618	15,035	115,428	16,942	4,877	208,900
1865	61,345	12,870	100,676	28,619	6,291	209,801
1866	58,856	12,307	96,890	36,691	3,138	204,882
1867	55,404	12,866	88,623	31,193	7,778	195,963
1868	58,268	14,954	64,965	51,956	6,182	196,325
1869	90,416	22,559	73,325	65,763	5,975	258,037
1870	106,283	22,935	74,283	48,306	6,033	258,940
1871	102,452	19,232	71,067	53,246	6,458	252,455
1872	118,190	19,541	72,763	79,023	5,696	295,213
1873	123,543	21,310	83,692	72,198	10,069	310,612
1874	116,490	20,286	60,496	38,465	5,277	241,014

After distributing, proportionally, 5277 emigrants whose birth places were not distinguished, the number of *English* emigrants during the year 1874 was 118,855, of Scottish 20,663, of Irish 61,964, and of Foreign 39,532.

The falling off in 1874 was in the emigration to North America, the number of emigrants being 96,670 less than in 1873, viz., 84,912 less to the United States and 11,758 less to British North America.

This large decrease, so far as regards natives of this country, is attributed partly to the rise in the rates of wages here, and partly to the general commercial depression and the unprofitable state of the labour markets in the United States. The latter reasons probably account for the large decrease in the number of foreigners who passed through this country during the year.

NUMBER OF EMIGRANTS to the UNITED STATES and to the NORTH AMERICAN COLONIES in 1873-74.

YEARS.	English.	Scotch.	Irish.	Foreign.	Total.
1873	100,397	17,988	81,438	70,458	270,281
1874	73,269	12,283	62,281	35,773	173,611
Decrease in } 1874 - }	27,128	5,700	29,157	34,685	96,670

The following results show the most noteworthy feature in the emigration returns of 1874, viz., the large increase in the number of emigrants to the Australian Colonies.

NUMBER OF EMIGRANTS to the AUSTRALIAN COLONIES in 1873-74.

YEARS.	English.	Scotch.	Irish.	Foreign.	Total.
1873	19,002	2,881	3,506	1,039	26,428
1874	36,593	7,057	8,985	1,323	53,958
Increase in } 1874 -	17,591	4,176	5,479	284	27,530

This large increase is mainly due to free and assisted passages being now offered by the agents of several of the colonies to artisans and others. It is believed, however, that the numbers have been swelled by unsuccessful emigrants who have returned from the United States.

The number of returning emigrants is not distinguished in the returns, but it was shown in the Census Report of 1871 that large numbers of emigrants to the Colonies and to the United States do return to England, and the average annual number in the ten years 1861-70 was estimated to be about 25,000.

The number of persons *who landed* in this country from passenger vessels in 1874 was 118,129 being the largest number on record. The results in each of the years 1870-74 were as follows:—

Years.	Number of persons landed in this country from passenger vessels.			
1870	-	-	-	49,157
1871	-	-	-	53,827
1872	-	-	-	70,181
1873	-	-	-	86,416
1874	-	-	-	118,129

It would be instructive to know how many of these consisted of persons who had previously left these shores as emigrants.

100,527 or more than 85 per cent. of the immigrants in 1874 came from the United States, and it is believed that the greater part of these were artisans unable to obtain remunerative employment there owing to the depressed state of the markets.

The growth of the population in England and Wales in 1874 occasioned by the excess of births over deaths was 328,324 but this does not represent the true increase; emigration, immigration, and unregistered births are elements which have to be taken into consideration in arriving at a correct estimate of the increase. The estimated population at the middle of the year 1874, based on the actual rate of increase during the 30 years 1841-71 was 23,648,609.

Meteorology.—The principal meteorological features of the year 1874 were the deficient rain-fall all over the country, and the extraordinary period of cold weather during the last six weeks of the year. Only 20 inches of rain fell at Greenwich during the whole twelve months. This quantity was 10 inches less than that in 1872 and 5·4 inches below the average annual fall. The mean temperature of the air was 49°·3, or nearly the same as the average.

The mean temperature of January was remarkably high being 50°·4 above the average of 103 years. In May, three weeks of low temperature succeeded seven weeks of warm weather, and the excesses of temperature

towards the end of April were as much as 10° and 13° . From 21st November to the 1st January 1875, the cold was severe, on some days in December the temperature was as much as 14° in defect of the average. On the 31st December it was painfully cold, being as much as $16\frac{1}{2}^{\circ}$ in defect.

The meteorology of this year 1874 is fully described by Mr. Glaisher, F.R.S., in his remarks on pp. xxxii-iv, who also shows in his tables the meteorological variations at different places. See pp. civ.-vii.

Prices.—Strikes and disputes between masters and men during the year 1874 brought various important industries to a stand-still. Wages in the mining, iron and steel trades fell. The price of commodities and the wages of labour generally declined. The excessive prices of previous years retarded and in some cases prohibited consumption.

The harvest was the best and most abundant since that of 1868. The quantity of wheat imported for home consumption was 41,527,638 cwts., or 2,335,460 cwts. less than in 1873, and the price of wheat was lower: a reduction in the quantity imported for home consumption generally indicating a plentiful harvest.

YEARS.	Quantities of Wheat imported for Home Consumption.	Average Price of Wheat per Quarter in England and Wales.
	Cwts.	s. d.
1865 - -	20,962,963	41 9
1866 - -	23,156,329	40 11
1867 - -	34,646,569	64 5
1868 - -	32,639,768	63 9
1869 - -	37,696,828	48 2
1870 - -	30,901,229	46 10
1871 - -	39,389,803	56 10
1872 - -	42,127,726	57 1
1873 - -	43,963,098	58 8
1874 - -	41,527,638	55 9

The autumn and winter of 1873 were very favourable for sowing the wheat crop of 1874, and the extent of land under wheat in England and Wales amounted to 3,509,309 acres: more by 139,655 acres than in 1873.

Both beef and mutton were somewhat cheaper in 1874 than in the previous year.

The average price of beef by the carcase at the Metropolitan meat market ranged from $5\frac{1}{2}d.$ to $8\frac{1}{2}d.$ per lb. The prices of mutton ranged from $5\frac{1}{2}d.$ to $8d.$ per lb. Best potatoes at the waterside market were much cheaper than in 1873, being 11s. per ton instead of 158s. 6d. per ton.

Pauperism.—The returns of pauperism were lighter. The average number of paupers relieved on the last day of each week was 137,197 in-door, and 609,328 out-door, against 137,775 in-door, and 656,843 out-door in the previous year.

The annexed statement shows the results of four Censuses of paupers on the 31st December 1871-4 exclusive of lunatics in asylums and vagrants.

	In-door.	Out-door.	Total.
1871 - -	150,093	780,809	930,902
1872 - -	147,657	690,979	838,636
1873 - -	144,201	637,269	781,470
1874 - -	146,947	603,468	750,415

The decrease from 1873 to 1874 was 31,055, or 4.0 per cent.

MARRIAGES.

The state of trade and national industry is strikingly exhibited in the fluctuations in the marriage-rate (persons married to 1000 population) of the last nine years, 1866-74.

The period of commercial distress which began about the middle of 1866 did not diminish the number of marriages to any extent in that year, for the rate was high, 17·5; but this period of depression continued during five years, 1867-71, and influenced the marriage-rates of those years, which were 16·5, 16·1, 15·9, 16·1, and 16·7 respectively.

In 1872 and 1873 the working classes became excited under the rapid advance of wages and diminution in the hours of labour, and the marriage-rates rose to 17·5 and 17·6 respectively.

In 1874, a year of commercial difficulties, a re-action set in; the great trades of iron, coal, hardware, and shipbuilding were somewhat depressed: there were contests between masters and men, and reduced demand for labour brought down wages, so the marriages in the year 1874 were 202,010, or 3605 below the number in 1873, and the rate was 17·1.

The number of marriages in proportion to population varies in the different counties. High rates prevailed in the metropolitan and manufacturing counties—the great centres of commercial industry—where the skilled artisan and the industrial classes have opportunities of earning high wages, while in the agricultural counties, where the wages of the labouring population were comparatively low, the marriage rate was also low.

Forms of Marriage.—Of the 202,010 marriages in the year, 150,819, or 75 per cent., were solemnized according to the rites of the Establishment, and 51,191 or 25 per cent. not according to the rites of the Establishment.

The marriages by licence were 17,659; these have decreased more or less during the last 15 or 20 years, while the marriages after banns, which were 128,462 in 1874, have increased during the same period. The number by Superintendent Registrars' certificates was 3808, while in 860 cases the clergy omitted to state under which of the foregoing heads the marriages should be recorded; the number of such omissions is gradually decreasing, but it is to be regretted that they are still to be counted by hundreds.

The marriages among Roman Catholics in 1874 were 8179, the numbers during the last ten years fluctuated from 7231 to 8911. In some cases of mixed marriages between Protestants and Roman Catholics the couples were married twice, and were counted twice in the registers. The number of marriages among other Christian denominations was 21,253, about the same number as that performed at the Superintendent Registrar's office, 21,256. The marriages according to Quaker rites were 47 against 79 in the previous year. The marriages among Jews are increasing; the number in 1874 was 456.

Of 100 couples who married in 1874 according to the rites of the Established Church ·02 married by special license, 11·71 by license, 85·18 after banns, and 2·52 by Superintendent Registrar's certificate, while in ·57 per cent. it was omitted to be stated under which heads the marriages should be classed. Of 100 weddings not according to the rites of the Established Church there were 15·98 in Roman Catholic chapels, 41·52 in registered places belonging to various other Christian denominations, ·09 among Quakers, ·89 among Jews, and 41·52 at Superintendent Registrars' Offices.

First Marriages; Re-marriages.—202,010 marriages were contracted in 1874. Of the bachelors who married, 165,018 chose spinsters, while

9295 selected widows. The number of widowers who married spinsters was 16,459, while 11,238 widowers married widows, so 27,697 widowers, re-married, and 20,533 widows re-married. The number of persons, therefore, who married a second time in 1874, was 48,230. There is but little fluctuation in the proportions from year to year.

The number of marriages of divorced persons in 1874 was 61, viz., 59 in which one or other of the contracting parties is stated to have been previously divorced, and 2 in which divorced men married divorced women. Of 34 divorced men who re-married, 27 married spinsters, 5 married widows, and 2 married divorced women. Of 29 divorced women who re-married, 18 were married to bachelors, 9 were married to widowers, and 2 were married to divorced men.*

The number of these marriages is increasing. Only 29 were registered in the year 1862, whereas in 1868 there were 40, and in 1873, 62. In the 14 years 1861-74, there were 537, viz., 524 in which one or other of the contracting parties had been previously divorced, and 13 in which divorced men married divorced women.

Ages at Marriage.—The marriage registers are imperfect; the precise ages of the married not being returned in a considerable number of cases. Of the 202,010 marriages registered in 1874, the ages of *both* parties were stated in 149,848 instances only, so that in 52,162 cases the Officiating Minister, or Registrar of marriages, returned the words “of full age,” “minor,” or “under age,” as the case might be.

This is to be regretted, for if all the ages were returned, it would afford the means of determining with greater accuracy the mean age at marriage in England, the probable duration of the joint lives of husband and wife, the annual rate of marriage at different ages, and many other important social questions.

The returns are less imperfect now than they were in 1855, when the ages of both parties were not returned in 42 per cent. of the total marriages, whereas in 1874, 26 per cent. was the proportional number of cases of imperfect returns.

The gradual improvement which has taken place in England during the last 20 years is shown in the subjoined table :—

YEARS.	To every 100 Marriages the number of cases in which the ages of both parties were not returned.	YEARS.	To every 100 Marriages the number of cases in which the ages of both parties were not returned.
1855	42·8	1865	35·1
1856	42·1	1866	33·6
1857	40·9	1867	33·5
1858	40·6	1868	33·0
1859	38·9	1869	31·2
1860	37·5	1870	30·1
1861	36·7	1871	29·0
1862	36·4	1872	27·7
1863	35·3	1873	27·0
1864	34·9	1874	25·8

* The number of decrees of divorce pronounced by Her Majesty's Court for Divorce and Matrimonial Causes in the year 1874 was, nisi 284, absolute 194.

The annexed table shows the proportion of imperfect returns in the year 1874 in each registration division of England and Wales :—

GROUPS OF COUNTIES.	To every 100 Marriages the number of cases in which the ages of both parties were not returned.	GROUPS OF COUNTIES.	To every 100 Marriages the number of cases in which the ages of both parties were not returned.
Yorkshire - - -	10·7	South Eastern Counties -	28·2
Northern Counties -	14·6	Eastern Counties - -	28·3
Monmouthshire and Wales	14·6	South Western Counties -	28·2
North Western Counties -	18·1	South Midland Counties -	31·3
West Midland Counties -	21·6	London - - -	52·8
North Midland Counties -	24·7		

Yorkshire supplied the greatest proportional number of perfect returns, but even in this county the ages of both parties were not stated in the marriage register in 11 instances out of every 100 marriages. In Wales, and in the Northern counties of Durham, Northumberland, Cumberland, and Westmorland, the proportion per cent. of imperfect returns was 15, in Lancashire and Cheshire 18 per cent. The groups of counties furnishing very imperfect returns were the South Midland, 31 per cent., the South-eastern, Eastern, and South-western, 28 per cent. But it is in London that the returns were most imperfect, for there the ages were omitted by the Officiating Minister, or Registrar of marriages, to the extent of 53 per cent.

The mean age at marriage as determined from the 149,848 persons whose ages were stated in the year 1874, including the re-married, was 27·9 years for men, and 25·7 years for women. For 130,965 bachelors it was 25·7 years, and for 135,458 spinsters 24·3 years. The mean age of the widowers who re-married was 43·0 years, and of widows 39·4 years. A comparison of these results with those in 1867 shows that the mean age at marriage is slightly lower than it was.

The number of men who married in 1874 under 21 years of age was 16,919, and the number of women not of full age was 45,859; so that of every 100 men married 8·4 were not of full age, and of every 100 women who were married 22·7 were not of full age.

The proportions differ but little from those of the previous year, but are nearly double those of the year 1844, when they were 4·2 and 13·2 per cent. respectively.

Two girls were married, at the early ages of 14 years, by widowers whose ages were 24 and 40 years respectively. Of 6576 widows who were married to bachelors in 1874, and whose ages at marriage were stated, 12 were under 20 years of age.

Signature in Marriage Registers.—The marriage register abstracts show a gradual improvement in the state of the elementary education of the people, especially of women whose education has been unhappily neglected. In the year 1874 now under review, 36,117 men and 48,903 women were

obliged to sign the marriage register with marks, so 82·1 per cent. of the men, and 75·8 per cent. of the women, were able to write. Although these proportions are much larger than they were 30 years ago, when only 66·8 of the men and 50·4 of the women were able to write, still it is a deplorable fact, that 17·9 per cent. of men and 24·2 per cent of the women of England were unable to sign their names in writing.

The counties, &c. where education has been greatly neglected, and which have so frequently been referred to in previous reports as claiming most attention, are Monmouth, Bedford, Wales, Stafford, Hertford, Suffolk, and Norfolk, where from 26 to 32 per cent. of the men, and from 19 to 41 per cent. of the women were unable to write. The education of women has also been much neglected in the counties, &c. of Salop, Warwick, Nottingham, Chester, Lancaster, West Riding of York, and Durham.

It has been stated that proportionally more women could write in Scotland than men in England, and such was the case in the year 1862, when 79·7 per cent. of the women in Scotland, and 76·3 per cent. of the men in England signed in writing, and the respective proportions in the ten years 1862-71 were 79·1 for women in Scotland, and 78·5 for men in England, but this is no longer the case. More satisfactory progress has been made in recent years in England, and the results of educational efforts show now that proportionally more men can write in England than women in Scotland.

Elementary national education is now only beginning to make satisfactory progress, for it is estimated that at least 3,224,580 children in England and Wales should attend public elementary schools, but the average daily attendance at the 12,167 aided day schools in 1874 was only 1,678,759, while accommodation was provided for 2,871,826 scholars.

It appears, therefore, that all that is now wanting to complete the educational efforts of recent years is the adoption of some means to insure a better attendance at school, and this question is now receiving the attention of the Legislature.

The average *day and night* attendance has risen—from 1,225,764 in 1870 to 1,727,449 in 1874.*

Buildings registered for Marriages.—The number of these buildings registered in 1874 was 239, bringing up the total number on the register at the end of the year to 7375. Of the 239 registered during the year 2 belonged to Presbyterians, 38 to Independents, 45 to Baptists, 1 to the United Brethren or Moravians, 15 to Roman Catholics, 5 to Unitarians, 105 to the various sects of Wesleyan Methodists, 16 to Calvinistic Methodists, 1 to the New Jerusalem Church, 2 to the Catholic and Apostolic Church, and 9 to other places of worship.†

Certified Places of Worship.—The number of places of meeting certified for religious worship during the year 1874 not being churches or chapels of the Established Church was 487. The number on the register on 31st December 1874 was 20,033. The following is a list of the various titles by which religious denominations have been certified to the Registrar General. The name printed in italics has been added since the publication of the list in my last Report.

* See Report of the Committee of Council on Education, 1874-5, pp. ix. and xiv.

† For the distribution of the 7375 buildings now on the register, under the various denominations, see Table 9, p. lxxiv.

BIRTHS.

The number of births registered in 1874 was 854,956, or 25,178 more than in the previous year. The rate was as high as 36·2 per 1000, while the annual average rate in the 10 years 1864-73, was 35·4 per 1000. The rate in 1874 in England was, of course, exceeded in the counties having the highest proportions of married women at the childbearing ages, such as Durham, where it was 46·7, Stafford 43·8, Monmouth 40·3, Lancaster 40·2, Northumberland 39·9, Derby 39·9, West Riding of York 39·7, Nottingham 39·2, South Wales 39·0, and Warwick 38·3.

Sex.—The number of male children born in 1874 was 435,179, of female 419,777, so 104 males were born to every 100 females: the proportions fluctuate considerably in the several counties in different years.

Births to a marriage.—Assuming that the interval between the mean age of marriage and the mean age of the mothers in England is 6 years, then the legitimate births in 1874 divided by the average number of marriages in the three years 1867-9 will give the average number of births to a marriage—4·57. In the year 1864 the proportional number was 4·30, so to every 100 marriages in England there are now 457 births, whereas ten years ago there were 430, or 27 less. This is no doubt owing to some improvement in the registration of births. The annual number of legitimate births to every 100 married women aged 15 and under 55, in the 10 years 1861-70, was 22·35.

Children born out of Wedlock.—The rate of illegitimacy in England is declining. Of the 854,956 children whose births were registered in 1874 43,103 were born out of wedlock, so 5 per cent. of the total births registered were illegitimate. Since the year 1845 when the per-centage was 7, the proportional number of illegitimate births has gradually declined. No doubt many of the births that escape registration are those of illegitimate children, still there is no reason to believe that a greater proportion escape registration now, than formerly, especially as the registrars have an interest in recording every birth, but the results of 1875, the first year of compulsory registration of births, will supply fuller information on this subject. The proportional number of illegitimate births, annually, to every 100 spinsters and widows, aged 15 and under 55, in England, was 1·66 in the ten years 1851–60 and 1·64 in the following decade 1861–70.

DEATHS.

526,632 deaths were registered in England in the year 1874, or 34,112 more than in the previous year. The rate of mortality for the year was 22·3 per 1000 of population, exactly the same as the mean rate in 1838–74, but 1·2 per 1000 above the rate of the previous year. Nearly one half of the above excess was specially attributable to scarlet fever and measles, while atmospheric and other agencies raised the deaths from many causes.

An inquiry into the *causes* of the deaths of the year, by Dr. Farr, —showing which of these have prevailed with mitigated severity—will be found in the Appendix to this Report, pp. 219–224.

Certain zymotic diseases have a tendency to return in cycles of longer or shorter periods, and communities generally suffer from such epidemics in proportion to their sanitary condition. One after another the defects in the sanitary laws of the country are being removed and it is impossible to overrate the importance of the sanitary inquiries and inspection now carried on through the agency of the Medical Department of the Local Government Board.

The information relating to the local prevalence of any disease, obtained from my Quarterly Returns, from the Registrars of Births and Deaths, from the Medical Officers of Health, and from other authorities, enables special local inquiries to be immediately instituted by personal medical inspection, or by correspondence, and this must result, sooner or later, in an improved state of the health of the people inhabiting the urban and rural sanitary districts: it is in this way that the greater part of the country will in process of time come under sanitary surveillance.

The number of sanitary jurisdictions in England in 1874 was 1558. In about 900 of these the Local Government Board pays part of the local salaries and is consequently entitled to receive copies of the reports of the Medical Officers of Health, but with respect to about 658 jurisdictions, in which no such assistance is afforded, the Board is not entitled to receive the reports. The precise number of Medical Officers of Health is unknown.

Sex and Age.—Of the 526,632 deaths registered in the year under review 272,178 were males and 254,454 were females. The male death-rate was 23·6 per 1000, the female 21·0 per 1000. These rates at all ages differed but little from the average in the 25 years 1848–72,* but a comparison of the mortality of children and adults, at the *different ages*, with the average annual rates in the 25 years shows that for both males and females the mortality at each period of age up to 35 was comparatively low. At and after that age the mortality was higher. The average rate observed in the 25 years includes periods when great epi-

* See Preliminary Tables, No. 27.

demics were prevalent. In the subjoined table the death-rate of the year is compared with the average in the ten years 1856-65 which was less disturbed by serious epidemics; but the general results are nearly the same.

There is a close connection between the climatic conditions of the atmosphere and the mortality. Temperature is one of the most important elements in regulating the death-rate, especially at the adult ages, and the excess or defect, in certain years, in the rates at the middle and advanced ages is greatly due to this cause.

The years in which the mortality, after the age of 35, was above the average, are generally those in which the meteorological elements have been very variable—a very low temperature of a few weeks duration perceptibly increasing the mortality from diseases of the respiratory organs. This is probably the cause of the excess in the death-rate after the age of 35 in the year 1874 when the mortality from this class of diseases was unusually high.

ENGLAND AND WALES.

AGES.	ANNUAL RATE OF MORTALITY PER 1000 LIVING.			
	In the 10 Years 1856-65.		In the Year 1874.	
	Males.	Females.	Males.	Females.
All Ages -	23·2	21·8	23·6	21·0
0—	73·0	63·3	72·0	61·7
5—	8·4	8·3	7·5	7·2
10—	4·7	4·8	4·0	4·0
15—	7·4	7·7	6·4	6·5
25—	9·5	9·7	9·7	9·2
35—	12·9	11·8	14·4	12·2
45—	17·9	15·1	20·6	15·8
55—	31·3	27·6	35·7	29·4
65—	66·4	56·4	70·7	61·6
75—	144·2	132·4	144·5	132·9
85—	306·8	279·5	307·5	273·7
95 and upwards	444·8	436·1	446·4	425·0

A comparison of the mortality of the two sexes shows that under 5 years of age the excess of mortality among boys is about one per cent., at the next age the excess is very slight, but from the periods of age 10 to 35 females die in greater proportion than males. At the ages 35-55, and at each subsequent period, the female is lower than the male rate.

It is believed that the expectation of life, at the different ages, among the married is greater than among the unmarried, but no abstracts showing the ages at death of the married and of the unmarried, have been made for England similar to those published for two years for Scotland. Such results would be interesting and instructive, and would enable me to show the difference between the mean age at death of the married, and of the single at marriageable ages; but such abstracts could only be made for married women and spinners for England, as the deaths of *married men* are not yet distinguished from the deaths of unmarried men in the English registration schedule.

Seasons.—It is to be regretted that no means have been taken to trace the varied influences which meteorological phenomena exert on the laws of health or sickness. Little more is known at present than that low tem-

perature and cold north and east winds increase the fatality of certain diseases, but how far the other various meteorological elements of the year disturbed the ordinary death-rate is unknown.

The mortality is generally highest in the three months of January, February, and March, when the temperature is lowest, but it was not so in 1874. The mortality in the first three months of the year was 23·4, or 1·4 per 1000 below the average, with a mean temperature (41⁸·4) 1⁰·4 above the average of 26 years, and a rain-fall of 2·4 inches, which is less than one half the usual amount. In the second quarter of the year the mortality was at the annual rate of 21·0 per 1000, the average being 22·0 per 1000; the mean temperature was the same as the average 52⁰·8, but the rain-fall was deficient, being only 4·2 inches against an average fall of 5·7 inches. In the third quarter of the year the mortality (20·8) was about the average, and the temperature (60⁰·9) deviated but little from the average: the rain-fall was 6·2 inches or 1·1 inch below the average. The mortality is not regulated so much by the mean temperature of the quarter, as by the extremes of temperature: an extraordinary period of cold weather prevailed from the middle of November till the end of the year, hence the mortality in the fourth quarter was 23·8 per 1000, or nearly 2 per 1000 in excess of the average. The mean temperature was indeed low, being 42⁰·3, or 2⁰ less than usual; the rain-fall, 7·2 inches, was near the average.

Full information respecting the meteorology of the year will be found in Mr. Glaisher's remarks on pages xxxii-iv.

Locality.—As previously stated, the mortality of England in the year 1874 was 22·3 per 1000. In ten English counties and in South Wales it was higher than this, but the mortality ranged from 17·0 in Dorsetshire to 28·3 in Lancashire.

In three Counties and one Riding of England,* the mortality is invariably very high, and their death-rate, in the year now under review, was higher than usual. If the sanitary laws had been administered in these places as well as they have been in London, no less than 26,400 lives would have been saved during the year, and if the mortality in 1874, in these three Counties and in the West Riding, had been at the same rate as that of London, the effect would have been to reduce the rate in England 1 per 1000; thus it is owing to the high rates continually prevailing in three or four counties, that the death-rate of the entire country is never below 20 per 1000.

Previously to the year 1865 the death-rates were computed for *counties* only, and the results exhibited a very wide range of mortality, but it was observed that all the highest rates occurred in those counties containing the great centres of the mining and manufacturing industries—where children abounded—so that it became necessary to ascertain the mortality in the large towns. These results are now published in a comparative form for each of the five years 1870-74.†

These large towns owing to their importance naturally attracted the early attention of the authorities, and in many of them the sanitary laws are, for the most part, now well administered, but it is to the sanitary supervision of the smaller town populations—represented by the urban and rural sanitary districts all over the country—especially in Lancashire and in the West Riding of York—that we must look for any reduction in the general death-rate of the country; and this great sanitary work is now ably carried out under the directions of the medical staff of the Local Government Board.

The annexed table shows the annual rate of mortality, (1) from all causes, and (2) from seven zymotic diseases in fifty *town districts*, in each of the years 1871-4.

* Lancashire, Durham, Northumberland, and the West Riding of York.

NOTE.—The mean rates of mortality in these Town Districts have been calculated from the numbers supplied by the local Registrars in their Quarterly Returns, which served as the basis of the annual rates published from time to time in the Registrar General's Quarterly Returns and Annual Summaries.

The letter M or P affixed to the name of each Town denotes whether the limits, which the District or Sub-districts in the last column approximately represent, are Municipal or Parliamentary.

* The area taken to represent the boroughs of Brighton, Rochdale, Huddersfield, and Halifax, was not so extensive throughout the four years.

† The rates of mortality for these towns have been corrected by the exclusion of a proportional number of deaths occurring in County Hospitals and Lunatic Asylums, situate within the Districts or Sub-districts here taken as representing the town, or by the exclusion or addition of a proportion of the deaths in Union Workhouses in cases where a portion of the Union only is embraced by the area taken, or where the Workhouse is situated outside that area.

There are many districts in England where the good effects of the sanitary administration of the last 20 or 30 years can be traced. Those in the annexed table may be cited as examples of such improvement.

DISTRICTS of ENGLAND and WALES showing some IMPROVEMENT in the ANNUAL RATE of MORTALITY in the THREE DECADES 1841-50, 1851-60, and 1861-70.

* The District of Salisbury was abolished, and the sub-district of Salisbury transferred to the District of Alderbury, in the year 1869.

The district of North Witchford affords a striking instance of the important results that can be attained through health administration. The average annual mortality fell from 27 per 1000 in 1841-50, to 21 in 1851-60, and to 20 in 1861-70: in the four years 1871-4, the results are still more remarkable, the mortality being reduced to 17 per 1000.

In Whittlesey, a steady improvement in the mortality is also discernable from 25 per 1000 in 1841-50, and 23 per 1000 in 1851-60, to 21 per 1000 in 1861-70; in 1871-4 the rate fell to 19 per 1000.

In Wisbech sanitary supervision commenced soon after the cholera epidemic of 1854. In 1866 the town was supplied with pure water, and extensive sewerage works are now completed. The annual death-rate of this district has been reduced from 25 per 1000 in 1841-50 to 19 per 1000 in 1871-4.

The great land drainage works have had great influence in improving the health of the inhabitants of the Isle of Ely. By their means the atmosphere has been purified and dried, and the returns for Wisbech show a marked diminution in the death-rate from phthisis, the average annual mortality per 1000 living in the 10 years 1851-60, being 2.0, whereas in the ten years 1861-70 it was reduced to 1.6.

In Orsett the remarkable reduction in the death-rate during the 30 years 1841-70 is partly due to sanitary improvements, but mainly to the drainage of the land and consequent dryness of the soil. In the four years 1871-4 the mortality was only 17 per 1000. The annual rate of mortality from phthisis decreased from 2.8 per 1000 in 1851-60, to 1.9 per 1000 in 1861-70.

Reference has already been made in some of my previous reports to the good effects of drainage and water supply in the district of Salisbury. Before any improvements were made, the annual death-rate in 1841-50 was 28 per 1000, but by the year 1855 an excellent system of drainage was in operation, and the district was supplied with pure water, so the annual rate was reduced in 1851-60 to 24 per 1000, and in the following decade it was still further reduced to 20 per 1000. The city of Salisbury, with a

population in 1871 of 12,903, appears to be in a good sanitary condition, the annual mortality in the four years 1871-4 being at the rate of 21 per 1000.

In Wolverhampton the annual mortality has fallen from 28 per cent. in the 10 years 1851-60 to 24 in the four years 1871-4. Dr. Love, the Medical Officer of Health, attributes this reduction to various sanitary improvements carried out since 1858. In 1865 the town was entirely re-sewered, and a more wholesome water supply obtained, but much still remains to be done to put Wolverhampton in a good hygienic state.

The cause of the great improvement in the health of Coventry is attributed by Dr. Fenton to the progress of sanitary works. Such improvements have been the means of reducing the annual death-rate from 27 per 1000 in the 10 years 1841-50, to 25 per 1000 in the 10 years 1851-60, and to 21 per 1000 in the 10 years 1861-70. In the four years 1871-4 the mortality rose to 24 per 1000. This was owing to an epidemic of small-pox in 1871-2, and of scarlet fever among children in 1873-4.

Previously to any sanitary improvements in Macclesfield the mortality of this district, in 1841-50, was at the annual rate of 26 per 1000. In 1853-6, sewerage works were executed; in 1851-2, the town was provided with an improved water supply, and various other sanitary measures were adopted, but the condition of Macclesfield was far from satisfactory, for the mortality of the district, in 1851-60, was 25 per 1000. In the following decade however, 1861-70, it fell to 23 per 1000.

Kingston-upon-Hull presents another example of the good effects of sanitary measures. Mr. Holden, the Medical Officer of Health, states that cholera was appallingly fatal in 1849; in proportion to population, it suffered more from cholera than any district in the kingdom.* The annual rate of mortality, from all causes, in the 10 years 1841-50, was 31 per 1000. An investigation showed that the drainage was bad, and the water—derived entirely from the river Hull—received the sewage of such places as Driffield and Beverley. The Local Board of Health, incorporated in 1851, began to carry out sanitary improvements, and in the 10 years 1851-60, the mortality was reduced to 25 per 1000. In 1864 the river water was abandoned, and the town received a constant supply of pure water from the springs rising out of the chalk wolds at Derringham. What has been effected is encouraging, but the mortality of Hull may be still further diminished, for in the 10 years 1861-70 the mortality was 26 per 1000, and during the four years 1871-4 it was 25 per 1000.

The improvement in the health of Newport is attributed by Dr. Davies to the extensive and complete system of drainage executed chiefly between 1851 and 1860, by means of which the sewage was swept into a tidal river about three miles from its mouth. The effect of the drainage has also been attended with the beneficial result of lowering the subsoil water. The town now receives a constant supply of good water. The mortality declined from 24 in 1841-50, and 22 in 1851-60, to 21 in 1861-70.

The mortality of the district of Merthyr Tydfil—the great centre of the iron manufactures of South Wales—in 1841-50, and in 1851-60, was at the high average annual rates of 28 and 29 per 1000 respectively. This was attributed by Mr. Dyke, the medical officer of health, to deficient drainage, to the absence of any system of scavenging, and to a scanty and impure water supply. In the year 1866 the drainage was completed, and a plentiful supply of pure water obtained, so that the annual rate in 1861-70 averaged only 25 per 1000. The sanitary state of the town, however, was not satisfactory, for the mortality in the four years 1871-4

* See Report on the Mortality of Cholera in England, 1848-9. By Dr. Farr, F.R.S., D.C.L., &c., pp. xxxvi—viii.

rose to 27 per 1000, owing to the prevalence of small-pox in 1872, of enteric fever in 1873, and of contagious fevers in 1874.*

The improvement in Crickhowell is mainly due to sanitary arrangements in the urban district of Brymnaur, which has been thoroughly drained and provided with an ample supply of pure water. Sanitary improvements are in progress, however, in various parts of Crickhowell. The mortality in the 10 years 1841-50 was at the annual rate of 27 per 1000; in the following decade, 1851-60, it fell to 25 per 1000, and in 1861-70 there was a further reduction to 23 per 1000, at which rate it continued during the four years 1871-4.

There are two districts in England exceptionally healthy; Glendale and Rothbury.† Their annual mortality during the 30 years 1840-71 was at the low average rate of 15 per 1000.

In Rothbury, a third of the population is employed in healthy occupations connected with agriculture. The remarkable low death-rates, ruling at the different ages, are shown in the subjoined table, where they are compared with the rates in the healthiest parts of England:—

AGES.	ROTHBURY DISTRICT.			HEALTHY DISTRICTS. of ENGLAND.	DIVISION II. SOUTH EASTERN COUNTIES.
	MEAN POPULATION, 1861-71.	DEATHS in the 10 Years 1861-70.	ANNUAL MORTALITY. — DEATHS to 1000 LIVING.	ANNUAL MORTALITY. DEATHS to 1000 LIVING.	
				1840-53.	1861-70.

75 and upwards	152	226	148.7	145.3	151.5

* The results of sanitary work in the *parish* of Merthyr Tydfil are thus recorded by Mr. Dyke:—

	Death-rate.
1. Before any works of sanitary improvements were begun; in the 11 years 1845-55	33 per 1000
2. During works of paving, inspection, and nuisance removal; in the 6 years 1856-61	28 "
3. After the addition of the water supply, and during the formation of main drainage; in the 4 years 1862-65	26 "
4. While drainage of houses was being effected; in the 7 years 1866-72	25 "

† In the Rothbury district the village of Harbottle has 120 inhabitants, and Dr. Frank Richardson states that among them are 37 children under 14 years of age. During the last 20 years no child has died. He gives another instance of the vitality of children in the parish. "A farmer and his three shepherds, who have occupied their present situations nearly 30 years, have among them 47 children, and not a single death has occurred in these families. The inhabitants have abundance of plain substantial food, excellent water, good residences as a rule, and regular but not severe work in a pure bracing atmosphere; they are highly intelligent and generally abstemious. I am indebted to the Rev. A. Procter, who has been upwards of 40 years the esteemed vicar, for the corroboration of the statistics of this parish which I have now given you."

Such exceptional cases are well worthy of study; and our young Health officers may learn a useful lesson of hygiene from these farmers and shepherds living on the southern slopes of the Cheviot Hills. Dr. Benjamin Richardson can scarcely hope that the mothers of his *Hygeia* will be more successful in rearing children—their lambs—than these shepherds' wives.

The district of Rothbury contains several very large ancient parishes. That of Alwinton on the southern slopes of the Cheviots extends over 46,681 acres, and comprises 16 townships. The population of this parish decreased from 1325 in 1861, to 1205 in 1871, when 39 births and only 9 deaths were registered, so the birth-rate of the parish in 1871 was 32·4 per 1000 of population, whereas the death-rate was but 7·5 per 1000.

The nine deaths registered during that year included two of infants under one of age, one of a person 25 years, three aged 50 and under 60, one aged 68 years, and another aged 92 years.

In the year 1874 only six deaths were registered, and assuming the population to have been stationary since 1871, the mortality was at the rate of only 5 per 1000.

Death-rates of Children.—The high rate of infant mortality in our large towns is attracting serious attention. It will be seen in the subjoined Table (No. 1) that a much larger proportion of infants under one year of age died in some towns than in others. In Liverpool, for instance, out of every 1000 births registered, the lamentably large number of 239 perished annually in the 5 years 1870–74, whereas the proportional number in London was 161, and in Portsmouth 148. In towns where a considerable proportion of the mothers were employed at factories, the results differed from those above: thus in Oldham the proportional number was 179, in Salford 192, and in Leicester 226. There were exceptional causes in operation in Leicester which have been reported on at the instance of the authorities. Among others the river was dammed up by mills, and the subsoil was consequently saturated: and it is suspected that infants were fed with milk from cows which drank water contaminated by sewage.

TABLE No. 1.—MORTALITY OF CHILDREN UNDER ONE YEAR OF AGE FROM ALL CAUSES IN EIGHTEEN LARGE TOWNS, 1870–74.

BOROUGHs, &c.	PROPORTIONAL NUMBER OF DEATHS under One Year to every 1000 Births registered in 52 or 53 Weeks in each Year.					Average Number in the 5 Years 1870–74.

Leicester	235	241	228	213	215	226
Liverpool	259	269	222	213	233	239

The principal causes which contributed to keep up these high rates of mortality among infants were teething, diarrhoea, convulsions, lung diseases, tubercular diseases, atrophy and debility, premature birth, and suffocation, and to these may be added the three epidemic diseases incidental to childhood, viz., measles, scarlet fever, and whooping-cough. The relative proportion of the fatality of these diseases in these six different towns is shown in the annexed Table (No. 2).

TABLE No. 2.—MORTALITY OF CHILDREN UNDER ONE YEAR OF AGE FROM DIFFERENT CAUSES, in SIX LARGE TOWNS, 1873-74.*

BOROUGHs, &c.	NUMBER OF DEATHS UNDER ONE YEAR OF AGE ANNUALLY in the Two Years 1873-74 to every 1000 BIRTHS REGISTERED.

* The results in this Table are deduced from the returns published in the Annual Reports of the Medical Officers of Health.

Thus in Liverpool where the highest mortality of infants prevailed, the proportional number of deaths from diarrhoea, convulsions, lung diseases, atrophy, and suffocation, was considerably higher than it was in London. The large number of infants suffocated in Liverpool demands special inquiry.

In the factory towns of Oldham, Salford, and Leicester the proportional numbers who died from convulsions were much larger than the number who died from this cause in London. It is not improbable that this is partly owing to maternal neglect. Dr. Tatham, the Medical Officer of Health for Salford suggests some legislative enactment for the greater protection of infant life in this class of towns, so as to check the employment of mothers in factories within a certain period after their confinement. Dr. Sutton the Medical Officer of Health for Oldham, also states that the high rate of mortality among infants was mainly owing to the absence of the mothers, who were occupied at the mills. The children suffer from indigestible food, and are pacified with soothing syrups containing narcotics, which engender convulsions, and combined with other causes rapidly destroy life.

The mortality from teething, lung diseases, atrophy, and premature birth was high in Oldham.

Summer diarrhoea—one of the most fatal maladies of infants in the large towns—appears to be brought about by heat in conjunction with certain local conditions of insalubrity. The question as to what those precise conditions are is now engaging the earnest attention of medical statisticians. The mortality from diarrhoea was excessive in Leicester, and so was the mortality from congenital atrophy.

The mortality from premature birth was highest in the factory towns.

In my last report attention was directed to the high rate of mortality in 1873 among children under five years of age which was stated to be 61·5 per 1000: this year, 1874, it was 66·9. A review of the different counties, &c. shows that the mortality of children at this age was highest in Lancaster 95·7, Durham 87·8, West Riding of York 82·9, Northumberland 78·0, Monmouth 77·6, Warwick 77·2, Stafford 75·8, Nottingham 74·7, South Wales 74·5, and London 71·3.

In the large towns these rates were exceeded, and through the courtesy of the Medical Officers of Health, who have furnished me with the number of deaths of children under five years of age for the year 1874, I am enabled to show the mortality in fourteen of these towns. The rate was

highest in Liverpool, 119·1 per 1000, Oldham 105·3, and Salford 100·9, then follow Leeds 99·2, Newcastle-on-Tyne 93·6, Manchester 93·2, Sheffield 91·7, Nottingham 91·5, Birmingham 90·5, and Leicester 86·7: the lowest rates were in Sunderland 77·8, Wolverhampton 76·6, London 71·2, Norwich 67·3, and Portsmouth 63·7.

In Liverpool more children, of this age, died from lung diseases than from diarrhoea, or diseases of the brain, and the high rate of mortality there was mainly due to those three causes; the proportional numbers dying from the usual epidemics of children—measles, scarlatina, and whooping-cough, not being so great.

Deaths in Public Institutions.—The tables relating to the number of deaths registered in Public Institutions of England and Wales* show that 45,865 or 8·7 per cent. of the total deaths in the year 1874 occurred in 1338 of the principal public institutions in England and Wales. Of these 45,865 deaths 29,415, or 64 per cent. occurred in 715 workhouses, 11,963, or 26 per cent. in 544 hospitals, and 4487, or 10 per cent. in 79 lunatic asylums. Only those deaths registered in workhouses, hospitals, infirmaries, and public lunatic asylums are returned, inasmuch as the mortality of the respective sub-districts in which they are situated is disturbed principally by the three classes of institutions. The increase in the total number of hospitals (44) during the year 1874 is mainly owing to a further extension of the system of cottage hospitals.

An introductory note on page 99 explains that the Table of Deaths registered in the Principal Public Institutions situate in the several districts and sub-districts (pp. 102–118) affords the means of correcting the mortality, which in some districts is unduly raised, owing to the number of deaths registered in hospitals and other large institutions within their limits.

A reprint of the table published in my annual summary for 1874 showing the number of Deaths registered in all public institutions of London is appended to this report.† In the 52 weeks of that year 13,359 deaths were registered in 152 public institutions. Of every 1000 of these deaths, 571 occurred in fifty-two workhouses, 5 occurred in twelve prisons, 6 in two military asylums, 323 in thirty-seven general hospitals, 29 in twenty-eight hospitals for special diseases, 6, viz., 1 woman and 5 children, in five lying-in hospitals, 15 in four naval and military hospitals, 9 in three hospitals for foreigners, and 36 in nine lunatic asylums.

PROGRESS OF REGISTRATION.

Names on the Registers, and Searches.—The names of the 1,785,608 persons, whose marriages, births, and deaths were recorded in the registers during the year 1874, have been inscribed in printed alphabetical Indexes deposited at this office.

These records, for the convenience of public reference, extend from the middle of the year 1837 to the end of 1874, and comprehend an aggregate number of names amounting to 52,278,834.

The annexed results show how rapidly the annual number of searches at this office is increasing. They are exclusive of searches in non-parochial registers, and of searches for purposes connected with the Factory Acts.

Years.	Total Number of Searches.	Average Annual Number.
1845–9	4,758	952
1850–4	8,344	1,669
1855–9	17,425	3,485
1860–4	35,127	7,025
1865–9	56,544	11,309
1870–4	91,458	18,292

* See pp. 99–118.

† See Preliminary Tables No. 37.

A considerable number of applications for birth certificates are made by candidates for civil service clerkships, for boys about to be apprenticed, and for boys about to be employed as messengers, &c. for post office purposes.

Of the 21,518 searches in 1874, certificates were granted in 17,190 instances. Registration certificates of 7539 births, 7046 deaths, and 2605 marriages were issued.

The total number of searches in 1874 (including those relating to the non-parochial and other records) was 22,354 and the number of certificates granted was 17,730.

The amount received as fees and paid into Her Majesty's Exchequer for searches and certificates in the year 1874 was 3,364*l.* 7*s.*

For a complete list of all the various public registers and records in my custody, I refer to my 34th Annual Report (pp. xxi-ii).

UNITED KINGDOM.

The estimated population of the United Kingdom at the middle of the year 1874 was 32,426,369. The emigration statistics of Ireland show that 73,184 natives left that country during the year, against 90,149 in the year 1873.

The number of births registered in Ireland in 1874, was only 141,288, or 26.6 per 1000 of population, the number of deaths registered was 91,961, or 17.3 per 1000. The excess of births over deaths registered was 49,327. The number of marriages returned was only 24,481, the marriage-rate being 9.2 per 1000. The above numbers are considerably understated, and the Registrar General of Ireland, in his last report, continues to direct attention to the defective state of civil registration.*

The estimated population of Scotland in 1874 was 3,462,916. The birth-rate of Scotland was lower than that of England, its death-rate was higher—23.3 against 22.3 per 1000 of population. The marriage-rate (persons married to 1000 persons living) in England was, as usual, considerably higher than that in Scotland—17.1 against 15.2.

THE ARMY.

The particulars of the deaths in the Army abroad are not returned to this office, but His Royal Highness the Field Marshal Commanding-in-Chief has favoured me with returns, distinguishing the numbers who died in Great Britain, Ireland, and abroad. The average strength of the army at home and abroad in the year 1874, was 186,389, and the number of deaths was 2136; the rate of mortality was therefore 11.5 per 1000 of mean strength; nearly the same as that in 1873.

At home, the average strength was 97,635, the deaths were 1007, and the rate of mortality per 1000 of mean strength was 16.1 among officers, and 10.0 among non-commissioned officers and men, against an annual average of 9.2 and 11.4 respectively in the twelve years 1861-72, so the mortality of officers was considerably above the average, while the mortality of the non-commissioned officers and men was below the average. The mortality in the year 1874 was higher than that of the previous year. This—according to the Army Medical Department Report—was chiefly attributable to the unfavourable causes affecting the health of the general population in England as shown in a higher death-rate. The mortality of the army at home was also somewhat unduly raised by "accidents," and by many invalids from abroad joining their depôts instead of going to

* See Eleventh detailed Annual Report of the Registrar General of Ireland, abstracts of 1874, p. 15.

Netley, the result being that more deaths were attributed to the force serving at home than were due to illness contracted there.

Abroad the mortality of the army was below the average during the year 1874. The strength was 88,754, the deaths were 1129, and the rate of mortality per 1000 was 13·8 among officers, and 12·7 among non-commissioned officers and men, against an annual average in the twelve years 1861-72 of 14·0 and 19·3 respectively.

THE NAVY.

Dr. Mackay, the Deputy Inspector General of the Royal Navy in his Report to Sir A. Armstrong, the Director-General of the Medical Department, says that the general sanitary condition of the service afloat was very satisfactory during the year 1874.

The total force was 44,530, and the deaths were 422, so the rate of mortality was 9·4 per 1000 against 8·3 in the previous year.

This increase of 1·1 per 1000 was mainly due to an outbreak of yellow fever in the receiving ship permanently stationed at Rio de Janeiro. The highest rate of sickness occurred in the China Station.

The operations in connection with the Ashantee Campaign on the West Coast of Africa raised the ratio from invaliding, but the mortality there was lower than in the preceding year.

The number of deaths in the total force from disease was 301, and from wounds, injuries, and drowning 121. The death-rate from disease was 6·7 per 1000, and from violence 2·7 per 1000, against 6·0 and 2·3 respectively in 1873.

Of the 301 deaths from disease 20 were referred to enteric fever, 13 to yellow fever, 18 to remittent fever, 63 to consumption, 21 to heart disease, 12 to aneurism, 33 to pneumonia, 10 to dysentery, 14 to stomach disease, 9 to kidney disease, and 3 to delirium tremens. In every 100 deaths 28·7 were from wounds, injuries, or drowning.

The mean force employed on the *home* station was 22,500, and the deaths were 175, being in the proportion of 7·7 per 1000, against 6·1 in the previous year.

The annexed Table shows the mortality at the different Stations during the years 1873 and 1874 :—

* Including the deaths by the loss of Her Majesty's ship "Captain."

† Including the deaths by the loss of Her Majesty's ship "Bombay."

BIRTHS AND DEATHS OF BRITISH SUBJECTS AT SEA.

Marine Register Book.—The number of returns relating to births and deaths of British subjects at sea transmitted to me by captains or commanding officers of British vessels, previously to the passing of the new Registration Act is very imperfect. Particulars of only 111 of such births, and 301 of such deaths, were reported to me in 1874, whereas the number of births and deaths of British subjects at sea reported to the Registrar-General of Merchant Shipping and Seamen was 510 and 1733 respectively. These records will be more complete now that the Registration Act of 1874 is in operation, for by the 37th section of that Act every captain or master, or other person having charge of a ship and failing to forward the necessary particulars, is liable to a penalty not exceeding 5*l.* for each offence.

Compared with the previous year there is an increase in the number of births and deaths reported to the Registrar-General of Merchant Shipping and Seamen in 1874 of 201, and 532, respectively, so, although the Registration Act did not come into operation until January 1875, it is probable that more care has already been exercised to secure correct returns.

Mercantile Marine.—The number of mariners at sea, exclusive of masters, in the year 1874, as reported by the Registrar-General of Shipping and Seamen, was 203,606. The deaths were 4602, and the rate of mortality was 22·6 per 1000 strength : this rate was above the average (21·5) of 23 years.

The number of mariners in the merchant service, exclusive of masters, whose deaths were referred to drowning, together with the mortality by drowning in the Royal Navy in each of the years 1866–74, are shown in the annexed Table.

DEATHS BY DROWNING in the Nine Years 1866–74.

* Including the deaths by the loss of Her Majesty's ships "Captain" and "Slaney."

In the 8 years 1866–73, 21,748 lives were lost in the merchant service by drowning, 13,244 by wreck, and 8504 by accident: the average annual number drowned in those years was 2719 or 13·7 per 1000 strength. The proportional number lost by wreck was 8·3 and by accident 5·4 per 1000.

xxviii Births and Deaths at Sea.—Wills.—European States.

The total loss in 1874 was 2859 lives, or 404 less than in the previous year, and as there was a decrease of 412 in the number of lives lost by *wreck*, it may be assumed that greater precautions were taken by the owners or masters of vessels to ensure the seaworthiness of their ships.

The average annual rate of mortality by drowning in the eight years 1866-73 in the Royal Navy was 2·7 per 1000 strength, so the risk of death by drowning in the merchant service was about *five times* as great as it was in the Royal Navy.

WILLS.

Mr. Leslie in his annual report of Judicial Statistics for 1874, publishes a return from the Senior Registrar of the Court of Probate, showing that the number of probates and administrations granted at the Principal Registry during the year was 17,029. The value of the effects was sworn under 67,027,730*l*.

The returns furnished by the district Probate Registrars record the number of probates and letters of administration granted in the 40 district registries during the year as 25,972. The value of the property under which these probates and administrations were sworn was 52,343,775*l*.

The results for the Principal and District Registries combined were—probates and administrations 43,001—value of effects sworn under 119,371,505*l*. The average value of each being 2776*l*. against 2894*l*. in the previous year. The proportion of the cases in which people above the age of 21 left wills, or left estates on which letters of administration were taken was 1 in 6, or 16·1 per cent.

Printed Calendars of all grants of probates and administrations from the year 1858 to the present time, showing the names and descriptions of the testators and intestates alphabetically arranged, together with other particulars, are deposited for public reference at this Office.

EUROPEAN STATES.

The details relating to vital statistics in Foreign States will be found in a series of tables on pages cxxiii-cxxviii. The annexed Table shows the annual rates, per 1000 of population, of persons married, births, and deaths in the various States from which returns have been received.

EUROPEAN STATES.

COUNTRIES.	AVERAGE ANNUAL RATES per 1000 POPULATION in the Years 1858-74.

* The mean annual rates for Spain are for the ten years 1861-70, those for Italy are for the ten years 1863-72.

In comparing the average annual results in the 20 years 1853-72, with those for the years 1873 and 1874, it must be borne in mind that deaths in war contributed to raise the mortality unduly in Austria in 1866; in Prussia in 1866, 1870, and 1871, and in France in 1870 and 1871. For explanation as to any remarkable increase in the respective rates from epidemics, see notes at foot of Tables, pp. cxxiv-cxxviii.

A comparison of the results of civil registration in the year 1874, in the several European States, with those in the previous year (see table on preceding page), shows that the marriage-rate (persons married to 1000 living) fluctuated but little except in Prussia, and in France, in each of which Countries it fell about 1 per 1000; but the rates in each Country, except Italy, were higher than the average observed in the 20 years 1853-72.

The marriage-rate was highest in Prussia and Austria, and lowest in Sweden and Italy.

The birth-rates were nearly the same as those of the previous year, except in Italy, where there was a fall of 1·4 per 1000. The highest birth-rates were in Prussia and Austria, where the marriage-rates were highest.

The death-rates in Austria, Prussia, the Netherlands, and France were considerably lower than in 1873, and also lower than the average of 20 years. In the other States the mortality was near the average.

DENSITY and PROXIMITY.

A comparison of the inhabitants of a country with the area on which they dwell, shows the density and proximity of population, and these differ considerably in different countries.

DENSITY and PROXIMITY of POPULATION in different EUROPEAN STATES in 1874.

EUROPEAN STATES.	Area in Square Kilometers.*	Estimated Population in 1874.	Hectars to a Person.†	Persons to a Square Kilometer.	Proximity or nearness of Person to Person in Meters.‡
England and Wales -	151,020	26,046,609	·6386	156·564	85·87
The Netherlands -	32,811	3,767,263	·8710	114·817	100·29
Italy - - -	291,881	27,289,968	1·0698	93·516	111·12
Prussia - - -	347,004	26,185,522	1·2778	72·580	126·13
Austria - - -	300,169	21,169,341	1·4179	70·635	127·96
France - - -	528,333	36,597,000	1·4516	68·890	129·47
Denmark - - -	34,649	1,860,600	1·8623	53·697	146·64
Spain (1870) -	512,968	16,935,613	3·0289	33·016	187·02
Sweden - - -	405,778	4,841,559	9·3462	10·700	328·51

Note.—The areas of Sweden, Prussia, and the Netherlands are exclusive of lakes and rivers; the area of Denmark is exclusive of lakes.

The areas in the above Table are those which were recently supplied by the Statistical Departments of the respective countries to the Board of Trade. They are here given in square kilometers, and the density and proximity in hectars and meters, in conformity with a resolution of the International Statistical Congress.

England has many cities, and there the density of population was greatest, for on an average the number of inhabitants to a square kilometer was 157. The Netherlands are second on the list 115, Italy is third 94; then follow Prussia 73, Austria 71, France 69, Denmark 54, Spain 33. In Sweden, where the population is sparse, there were only 11 persons to a square kilometer.

* A square kilometer equals ·3861162 of a square mile, or a square of 1000 meters to the side; a square kilometer also equals 100 hectars.

† A hectar contains nearly 2½ or 2·4711436 acres.

‡ A meter is a little longer than a yard; it equals 1·093633 yard.

The proximity or nearness of person to person was, therefore, closest in England, where, on the hypothesis of equal distribution, the people were 86 meters apart, in the Netherlands 100, Italy 111, Prussia 126, Austria 128, France 129, Denmark 147, Spain 187, and Sweden 329.

In the rural districts of a country, wages are comparatively low, skilled labour is at a discount, means are not afforded for earning large sums, and this is generally expressed in a low marriage-rate. The same argument holds good, though not to the same extent, with reference to small town districts, but in the principal towns, and large manufacturing and mining districts, skilled labour is at a premium, high wages are earned, commercial prosperity reigns, large numbers of women at childbearing ages congregate, and the people marry in high proportions; so, although the marriage and birth-rates of a country are invariably highest where the population is dense, still it cannot be said that density is the chief cause.

AREA and DENSITY in 1874, in different EUROPEAN CITIES
(arranged according to Area).

CITIES.	AREA in Square Miles.	PERSONS to an Acre.
London - - -	122'0	43'6
Paris - - -	30'1	96'0
Berlin - - -	22'9	56'6
Vienna - - -	21'3	47'2
Munich - - -	19'9	14'5
The Hague - -	8'6	17'3
Turin - - -	6'9	46'8
Amsterdam - -	5'5	79'6
Rome - - -	5'4	71'2
Brussels - - -	3'5	83'5

Density of population, however, does greatly influence the mortality of a country, and it is instructive to compare the relative degree of density in different European cities with the death-rate. This has been done in the annexed table for the year 1874, but no conclusions can be drawn from such comparison until the average annual rate of mortality can be ascertained for a series of years, for prevailing epidemics greatly interfere with the results for a single year.

DENSITY, PROXIMITY, and MORTALITY in different EUROPEAN CITIES in 1874
(arranged according to Density).

CITIES.	AREA.	Estimated Population in 1874.	DENSITY of POPU- LATION.		Proximity or nearness of Person to Person in Meters.	Mortality to 1000 Persons living.
	Square Kilo- meters.		Persons to a Hectar.	Persons to a Square Kilometer.		
Paris - - -	78'02	1,851,792	237'3	23,734'8	6'97	22'4
Brussels - - -	8'97	185,000	206'3	20,630'1	7'48	23'9
Amsterdam - -	14'34	282,000	196'7	19,665'3	7'66	26'7
Rome - - -	14'11	248,307	175'9	17,594'0	8'10	27'5
Berlin - - -	59'20	828,000	139'9	13,986'7	9'09	32'9
Turin - - -	17'79	214,426	120'5	12,055'1	9'79	26'7
Vienna - - -	55'25	644,356	116'6	11,662'6	9'95	24'6
London - - -	315'97	3,400,701	107'6	10,762'8	10'36	22'5
The Hague - -	22'23	91,305	42'7	4,268'8	16'45	26'5 (1874.)
Munich - - -	51'56	185,000	85'9	3,588'3	17'94	37'4

Arranging the cities in their order of density, it appears that Paris is the most populous, with 237 persons to a hectar, Brussels stands next in order of density with 206 persons to a hectar, then follow Amsterdam with 197, Rome 176, Berlin 140, Turin 121, and Vienna 117. London is low down on the list with 108 persons to a hectar, but the Hague and Munich have the lowest densities, viz. 43 and 36 persons to a hectar respectively.

The proximity or nearness of person to person in Paris was 7'0 meters, in Brussels it was 7'5 meters, Amsterdam 7'7, Rome 8'1, Berlin 9'1, Turin 9'8, Vienna 10'0, London 10'4, the Hague 16'4, Munich 17'9.

I have the honour to be,

Sir,

Your faithful servant,

GEORGE GRAHAM,

Registrar-General.

REMARKS ON THE METEOROLOGY OF 1874.

BY JAMES GLAISHER, Esq., F.R.S., &c.

The year 1874 was remarkable first for the extraordinary period of cold weather from the middle of November till the end of the year, and for the deficiency of rain during the whole year.

The following remarks with regard to excess or deficiency of atmospheric pressure, temperature, and rain-fall, are primarily derived from the observations at the Royal Observatory, Greenwich, but they may be taken as applying generally to the whole country.

Atmospheric Pressure.—The reading of the barometer decreased from 30·0 in., on January 1st, to 29·12 in. on the 3rd; increased to 30·2 in. on the 6th; was generally about 29·7 in. and 29·8 in., from the 8th to the 15th; decreased to 29·17 in. on the 16th, passed above 30·0 in. on the 21st, and continued at or above 30·0 in. till the end of the month. In February the readings continued high till the 13th, and after this day they were alternately above and below their averages till the end of the month. In March the readings were somewhat below their averages on the 8th, 9th, 10th, and 11th; again on the 19th, 29th, and 31st, on all other days they were above. During the month of April the barometer readings were variable, but generally below their averages from the 1st to the 14th; from the 15th to the 28th, a steady increase was experienced, and the maximum reading for the month 30·2 in., was attained on the last mentioned day. Throughout the month of May the readings were alternately above and below their averages. In June the barometer readings were above their averages from the 1st to the 23rd, below from the 24th to the 29th, and again above on the 30th, the highest reading in this month was 30·4 in., and the lowest 29·4 in., thus the range was 1·0 in. From the 1st to the 19th of July, the readings were variable, and generally above their averages, from the 20th to the 29th, they were below their averages, on the 30th and 31st the values were again in excess, but only to a small amount. From the 1st to the 14th of August, the readings were generally below their averages, the minimum occurring on the last-named day, viz., 29·3 in.; they were above their averages from the 15th to the 26th, the maximum value occurring during this period, 30·3 in., on the 21st; and they were again below from the 27th to the end of the month. During the period comprising the 1st to the 12th of September the values were all below their averages, from the 13th to the end of the month they were alternately above and below their average readings for short periods; the readings of the barometer from the 1st to the 16th of October were alternately above and below their averages, and from the 17th to the last day of the month, they were above (with the exception of two days, viz., 21st and 22nd, which were 0·33 in., and 0·19 in. below). From the 1st to the 11th of November the values were all above their averages, from the 12th to the 30th, below and above for short periods. From 1st to the 25th of December the readings were below their averages, except on a very few days, and from the 26th to the end of the year they were above.

Temperature.—The warm period which set in on 15th of December 1873, continued with very few and slight exceptions throughout the whole of January 1874, and until the 3rd day of February; the average daily excess of mean temperature for this period of 51 days was 4°·6, and for the 34 days from 1st of January to 3rd of February was 4°·7; during this lengthened warm period, the direction of the wind was usually a compound of the S. and W. On the 4th of February the wind was N.E., and a cold

period began, which continued till the 12th day, the average daily deficiency was $6\frac{1}{2}^{\circ}$. On the 12th day of February the direction of the wind changed to S.W., and the temperature passed above the average, and continued above for 19 days, its average daily excess was $3^{\circ}1$; this was followed by 10 days cold weather, from 4th of March to the 13th, and during this time snow fell generally over the country; from March 14th to the end of the month the weather was warm, the excess of daily temperature was $5\frac{1}{4}^{\circ}$ nearly.

The mean temperature of January was remarkably high, being $41^{\circ}7$, or $5^{\circ}4$ above the average of 103 years, and during this period there have been only 9 Januaries of similar warmth, viz., 1796, $45^{\circ}3$; 1804, $43^{\circ}2$; 1834, $44^{\circ}4$; 1846, $43^{\circ}7$; 1851, $42^{\circ}9$; 1852, $42^{\circ}0$; 1853, $42^{\circ}4$; 1863, $41^{\circ}8$; and 1866, $42^{\circ}6$. The warm period which began on 13th March continued with very slight exceptions throughout April, the average daily excess of temperature for this month being 4° . On several days towards the end of the month the days were warm, the excesses being as large as 10° and 13° . On 1st May a cold period set in, and continued without exception till the 21st; these three weeks of low temperature were very painful, following so immediately the heat of the preceding seven weeks. A period of warm weather occurred from the 22nd May to 11th June, the average daily excess was $4\frac{1}{2}^{\circ}$, and from this time to the end of the month low temperatures prevailed, the deficiency of daily temperature for this period being $4\frac{1}{2}^{\circ}$.

The mean temperature of April was $50^{\circ}0$, and on travelling back 103 years we find that there have been but five Aprils of so high a temperature as in the year 1874.

The year 1779, $50^{\circ}7$
 „ 1821, $50^{\circ}4$
 „ 1844, $51^{\circ}7$

The year 1865, $52^{\circ}3$
 „ 1869, $50^{\circ}3$

The cold weather which prevailed during the last three weeks of June, was succeeded at the beginning of July by weather which was generally warm, but frequently cold; the average daily excess over the average daily temperature till 2nd of August was $2\frac{1}{2}^{\circ}$. A period of moderately cold weather followed, (and with the exception of a few warm days), lasted till 19th September, the average daily deficiency for the 48 days ending September 19th was 1° ; and from the 20th to the end of the month the weather was warm, the daily excess being 5° . From the 10th October to 20th November the weather was warm, with the exception of a very few days which were somewhat cold; but on November 21st a severe cold period set in and lasted with but few exceptions till 1st January 1875, the average daily temperature of the 42 days ending this day was $33^{\circ}5$, being $6^{\circ}6$ below the average; the temperature was on some days in December as much as 14° in defect of the average, and on December 31st it was as much as $16\frac{1}{2}^{\circ}$ in defect, the mean temperature of this day was only $21^{\circ}1$, the day being painfully cold.

Since the year 1771, there have been only 7 instances of so low a mean temperature as in December 1874, which was $33^{\circ}2$. In the year

1874, $31^{\circ}0$	1799, $32^{\circ}8$	1844, $33^{\circ}0$
1788, $29^{\circ}0$	1840, $33^{\circ}3$	1846, $32^{\circ}9$
1796, $30^{\circ}4$		

Rain-fall.—The fall of rain in January was 1 in., being only one half of the average fall; in February it was $0^{\circ}94$ in., being about two thirds of the average, and in March it was $0^{\circ}45$ in. only, being less than one third of the average. The total fall in the three months ending March 31st was $2^{\circ}39$ in.; the average fall for these three months is $5^{\circ}0$ in., so that the fall is less than one half of its usual amount; back to the year

1815 the instances of falls in these three months, not exceeding 3 in., were as follow :—

1820 it was 3·0 in.	1829 it was 2·4 in.
1854 „ 2·9 in.	1874 „ 2·4 in.

So that the only instance of so small a fall in these months was in the year 1829.

In April the fall was 1·4 in., being 0·3 in. below the average ; in May it was 0·4 in. only, being 1·7 in. below the average ; and in June it was 2·4 in., or 0·5 in. above the average. Of the remarkable deficiency in May there have been only 9 instances of falls of rain of less than one inch back to 1815, viz. :—the fall in the year

1823 was 0·8 in.	1844 was 0·4 in.	1857 was 0·6 in.
1829 „ 0·6 in.	1848 „ 0·4 in.	1870 „ 0·5 in.
1833 „ 0·2 in.	1851 „ 0·8 in.	1871 „ 0·6 in.

In July the fall of rain was 2·6 in., being 0·1 in. above the average ; in August it was 1·4 in., being 1·0 in. below the average ; and in September it was 2·2 in., being 0·2 in. below the average. The fall of rain in the last three months of the year was 7·2 in., being 0·2 in. in excess of the average ; the total fall in the year was 20·0 in., being 5·4 in. below the average annual fall, and, therefore, the fall of rain during the whole year was remarkably deficient, this deficiency having prevailed all over the country.

The total falls of rain in the year ranged from 51·29 in. at Stonyhurst, to 17·78 in. at Royston.

PRELIMINARY TABLES.

TABLE 1.—Estimated Population, and Number of Marriages, Births, and Deaths registered in England in each of the Thirty-seven Years 1838-74.

YEARS ended Dec. 31st	Estimated POPULATION in ENGLAND in the Middle of each Year.*	MARRIAGES.	PERSONS MARRIED.	BIRTHS (exclusive of Still-born).	DEATHS	EXCESS OF BIRTHS OVER DEATHS.
1838	15,387,699	118,067	236,134	463,787	342,780	121,027
1839	15,514,355	123,166	246,332	492,574	338,984	153,590
1840	15,730,813	132,065	264,230	502,306	359,687	142,616

Mean in 37 years	16'5	33'9	22'3	61	30	45

NOTE.—The Table may be read thus:—In the year 1838 to every 10,000 persons living there were 154 persons married, 303 births, and 224 deaths; the number of persons living to every person married, birth or death, was 65, 33, and 45 respectively. The rates in this Table have been calculated upon the estimated populations given in Table 63, but no corrections have been made for the difference between an ordinary year of 365 days and leap year.

TABLE 3. Marriages in England in each of the Thirty-four Years 1841-74; those solemnized according to, and not according to, the Rites of the Established Church with other details respecting the Marriages in the Churches of the Established Church.

1874 -	41,413	52,827	49,144	58,626	14·2	17·9	16·5	19·7
Mean Annual Rate per 1000 in each quarter during the 37 years					13·7	16·9	15·9	19·6

Note.—The three months January, February, and March contain 90 days, and in leap year 91 days; the three months April, May, and June 91 days; and each of the last two quarters of the year 92 days. For this inequality a correction has been made in the above calculations.

* These rates may thus be read without reference to the decimal points:—In the March quarter of 1838, to 10,000 persons living, 124 persons were married.

TABLE 6.—Marriages in England. The Proportion per Cent. of **Minors** of each Sex, of Males and Females who **signed the Register with Marks**, and of Persons who were **Widowers** or **Widows**, in each of the Thirty-four Years **1841-74**.

Mean Annual Rate per 1000 in each Quarter during the 37 years					35'6	35'2	32'7	32'5

* These rates may thus be read without reference to the decimal points:—In the March quarter of 1838, to 10,000 persons living 308 births were registered. In the calculation of these rates a correction has been made for the varying number of days in the different quarters, see note to Table 5.

TABLE 12.—Proportional Number of Births in England in each Quarter to 1000 Births in the Average Quarter* of each of the Thirty-seven Years 1838-74.

YEARS.	NUMBER OF BIRTHS IN THE AVERAGE QUARTER.	PROPORTIONAL NUMBER OF BIRTHS.				
		In the AVERAGE QUARTER (assumed to be 1000).	FIRST QUARTER ending March 31.	SECOND QUARTER ending June 30.	THIRD QUARTER ending Sept. 30.	FOURTH QUARTER ending Dec. 31.

1874 -	11,512,956	12,135,653	23·6	21·0	107	113
Average proportion in 37 years, 1838-74 -			23·3	21·4	104	109

The Table may be read thus:—In the year 1838 to every 1000 males living there were 23·4 deaths to every 1000 females living there were 21·5 deaths and to each 100 females who died there were 105 deaths of males. The last column shows the relative mortality of males and females and that out of equal numbers living the deaths of males were as 100 to every 100 deaths of females in 1838.

TABLE 19.—Deaths of 69 Persons (16 Males and 53 Females) RETURNED AS Aged 100 Years and upwards in ENGLAND and WALES during the Year 1874.

District Numb.	DISTRICT.	DATE OF DEATH.	PLACE OF DEATH.	SEX.	STATED AGE.	OCCUPATION.	CAUSE OF DEATH.
1	Kensington - -	14 Jan. -	16, Thomas Street - -	F.	102	Wid. labourer -	Age.
5	Marylebone - -	12 May -	14, Carlisle-mews - -	F.	100	Wid. fishmonger -	Obstr. of bowels.
7	Panorama - -	1 Dec. -	11, Little Drummond Street -	F.	102	Wid. weaver -	Age.
9	Hackney - -	17 March -	16, Shaft Road - -	F.	100	Wid. painter -	Age.
13	" - -	24 Dec. -	1, Tryons Terrace - -	M.	102	Builder -	Age.
15	London City - -	7 July -	1, Saddlers Hall Court - -	F.	102	Wid. general dealer	Age.
21	St. Saviour St. Wk.	15 Sept. -	Workhouse - -	F.	103	Servant -	Bronchitis.

Note.—The Table may thus be read :—Of each 1000 male children living under five years of age, 72·3 died in each of the 37 years 1838-74 ; in the five years 1841-45 this proportion averaged 69·0 per 1000 ; and in the five years 1866-70 it was 73·0.

* The population used in these calculations is deduced from the ascertained rates of increase observed in the 30 years 1841-71 (see Table 62, pp. xc-1), distributed in the several groups of ages according to the proportions found to prevail at the last four Censuses.

1846-50	22'6	63'9	9'3	5'7	8'9	11'3	13'5	16'7	29'4	63'3	138'9	287'3 468'5
1851-55	21'8	64'0	8'5	5'3	8'5	10'4	12'4	15'6	27'8	59'0	136'2	283'6 440'1
1856-60	21'0	62'6	8'3	4'9	7'8	9'3	11'6	14'7	27'1	54'9	130'9	278'9 416'3
1861-65	21'5	64'1	8'2	4'8	7'6	9'8	12'1	15'4	28'0	57'9	133'9	280'1 455'9
1866-70	21'2	63'4	7'4	4'3	7'1	9'6	12'0	15'8	28'0	59'4	135'0	275'7 411'2

Note.—The Table may thus be read:—Of each 1000 female children living under five years of age, 62'4 died in each of the 37 years 1838-74 in the five years 1841-45 this proportion averaged 58'8 per 1000; and in the five years 1866-70 it was 63'4.

* The population used in these calculations is deduced from the ascertained rates of increase observed in the 30 years 1811-71 (see Table 62, pp. xc i), distributed in the several groups of ages according to the proportions found to prevail at the last four Censuses.

Mean Annual Rate per 1000 in each Quarter during the 37 years					24·8	22·0	20·6	21·9

* These rates may thus be read, without reference to the decimal points:—In the March quarter of the year 1868, in 10,000 of the population 262 deaths were registered. A correction has been made in these calculations for the inequality in the number of days in the different quarters, see note to Table A.

TABLE 29.—Proportional Number of Deaths in England in each Quarter to 1000 Deaths in the Average Quarter* of each of the Thirty-seven Years 1838-74.

YEARS.	NUMBER OF DEATHS IN THE AVERAGE QUARTER.	PROPORTIONAL NUMBER OF DEATHS				
		In the AVERAGE QUARTER (assumed to be 1000).	FIRST QUARTER ending March 31.	SECOND QUARTER ending June 30.	THIRD QUARTER ending Sept. 30.	FOURTH QUARTER ending Dec. 31.

* Letter M or P affixed to the name of each Town denotes whether the limits, which the District or Sub-districts in the last column represent, are Municipal or Parliamentary.
 * In this column are the numbers enumerated at the Census in April 1871, raised to the middle of 1874 by the addition of the annual rate of increase which prevailed between 1861 and 1871. A decrease of population between 1861 and 1871 was shown by a minus sign. In the case of the towns of Merthyr Tydfil, Macclesfield, and Ashton-under-Lyne; in these instances the enumerated population has been grossed up on the same principle.
 * of mortality for these towns have been corrected by the exclusion of a proportional number of deaths occurring in the Asylum, situated within the Districts or Sub-districts here taken as representing the town, or by the exclusion of the deaths in Union Workhouses in cases where a portion of the Union only is embraced by the district, or by the exclusion of the deaths in the Asylum situated outside that area.

Average Number living to One Annual Death in 35 years	41	44	44	40	38	41

NOTE.—The populations upon which these rates of mortality have been calculated are deduced from the numbers enumerated at the four Censuses of 1841, 1851, 1861, and 1871. The deaths used are those registered during the natural years from 1st January to 31st December.

Hamstead and Lewisham did not form part of London prior to 1847. Certain alterations affecting the West and Central groups of districts were made in the year 1868, but no corrections have been made in the results given in this Table for any year prior to 1861.

NOTE.—The numbers for 1837 were registered in the half year ending 31st December.

TABLE 45.—Area, estimated Population, and Marriages, Births, and Deaths registered in the United Kingdom, in the Year 1874.

—	AREA IN STATUTE ACRES.	AREA IN HECTARES.	Estimated POPULATION in the middle of the Year 1874.	MARRIAGES.	PERSONS MARRIED.	BIRTHS.	DEATHS.
UNITED KINGDOM	77,635,301	31,416,768	32,426,309	262,738	505,476	1,130,039	606,369
Great Britain - -	56,814,254	22,901,636	27,111,526	236,257	456,514	973,751	607,306
England and Wales -	37,319,221	15,109,008	22,648,609	202,010	404,090	854,966	526,632
Scotland - - -	19,496,133	7,792,630	5,462,916	36,247	82,494	123,795	80,676
Ireland * - - -	20,319,927	8,425,290	5,314,944	34,481	66,968	141,398	52,961

* On the authority of the Registrar General of Ireland it may be assumed that the numbers of marriages, births, and deaths, in that part of the United Kingdom are understated through defective registration.

TABLE 46.—Proportion per 1000 of Marriages, Births, and Deaths to the Population of the United Kingdom, in the Year 1874.

—	ACRES TO A PERSON.	HECTARES TO A PERSON.	TO 1000 PERSONS LIVING.			
			MARRIAGES.	PERSONS MARRIED.	BIRTHS.	DEATHS.
UNITED KINGDOM - -	3.30	.97	7.79	15.6	34.5	21.6
Great Britain - - -	2.10	.85	8.42	16.8	36.1	22.4
England and Wales - -	1.86	.64	8.54	17.1	36.2	22.3
Scotland - - - - -	5.63	2.36	7.53	15.3	35.7	23.3
Ireland - - - - -	3.98	1.59	4.61	9.2	26.6	17.3

Note.—The total area of a country, divided by its population, gives the average area to each person. The reciprocal gives the "density" of the population, or the population to each acre, square mile, or other measure.

* The deaths of soldiers, marines, and seamen from the Royal Navy, who were passengers in British Merchant Ships, were 35 in 1856, 59 in 1857, 156 in 1858, 196 in 1859, 196 in 1860, 69 in 1861, 123 in 1862, 116 in 1863, 96 in 1864, 140 in 1865, 164 in 1866, 97 in 1867, 81 in 1868, 61 in 1869, 27 in 1870, 24 in 1871, 1 in 1872, 6 in 1873, and 11 in 1874. The number is 1,665 in nineteen years, which, if added to the 12,374 above, makes 14,039, the total number of deaths of British subjects at sea in 1856-74, exclusive of those of merchant seamen. The Entries in the "Marine Register" of Births occurring in 1874 were but 111, and of Deaths 301.

* Deduced from a return of the number of accounts of wages and effects of seamen (exclusive of masters) dying before the termination of the voyage, received by the Registrar General of Shipping and Seamen. Since 1867 the return includes seamen dying ashore in foreign parts, whose wages and effects are delivered to the consuls or officers of the hospitals on their discharge from their ships.

If a seaman die on the passage from Sunderland to Calcutta, his death is reported at Calcutta, and his wages and effects are accounted for and transmitted home, if the vessel be not to return direct to the United Kingdom. But if a passenger die on board a ship which does not return to a British port immediately, but trades for a time in foreign parts, considerable delay may occur before his death is reported. In all cases, however, the date is given, and in the accompanying tables the births and deaths are classed according to the years in which they occurred. In some passenger-ships women are employed as stewardesses, and are counted as part of the crew. They therefore form part of the strength in this Table, and if the death of a stewardess occur in the course of a voyage, it is included in the column of Deaths.

When a ship is lost with all persons on board, the owners return the number and names of the crew, and the names of the passengers, when known, to the Registrar General of Shipping and Seamen.

TABLE 61.—RETURN of the AGES, RATING, and CAUSES of DEATHS of 4,602 Seamen reported to the BOARD OF TRADE as having died in the British Merchant Service in the Year 1874. (*Parliamentary Return, No. 312, Session of 1875.*)

TABLE 63.

ESTIMATED POPULATION OF THE UNITED KINGDOM,
 (including ISLANDS in the BRITISH SEAS)
 with Army, Navy, and Merchant Seamen abroad belonging thereto.*

Middle of the Census Years.	PERSONS.	MALES.	FEMALES.
1801 -	16,302,410	8,096,082	8,206,328
1811 -	18,532,522	9,194,348	9,338,174
1821 -	21,300,573	10,519,256	10,781,317
1831 -	24,423,588	12,004,025	12,419,563
1841 -	27,077,095	13,325,889	13,751,206
1851 -	27,764,034	13,656,998	14,107,036
1861 -	29,358,927	14,397,427	14,961,500
1871 -	31,914,985	15,622,725	16,292,260

* In estimating the number of men in the Army, Navy, and Merchant Service abroad, the proportion belonging to foreign countries and the colonies has been excluded. In 1811 the troops and seamen were 640,500, but as this number included natives of colonies and foreign parts, only 502,536 were taken.

The above numbers have been deduced by adding to the estimated population of the United Kingdom, as given in Table 62, the enumerated population of the Islands in the British Seas, and the Army, Navy, and Merchant Service abroad (see p. vii. of Vol. I. Census of England and Wales, 1871).

TABLE 64.—Logarithms of the above Populations of the UNITED KINGDOM.

NOTE.—Cholera is given as being chiefly the cause of the high rate of mortality in Denmark in 1853; in Sweden in 1853, 1857, and 1866; in Austria in 1866 and 1873; in Prussia in 1866; in the Netherlands in 1859 and 1864, where also small-pox prevailed in 1871; and in France in 1865 and 1866. War contributed to the same end in Denmark in 1859 and 1864; in Austria in 1866; in Prussia in 1866, 1870, and 1871; and in France in 1870 and 1871.

TABLE 74.—ITALY (inclusive of VENETIA). Population; Number, and Proportion per 1000, of Persons Married, Births, and Deaths, in each of the Years 1863 to 1874.

(Furnished by Signore L. Bodio, Director of the Italian Statistical Bureau.)

1874	27,289,958	207,997	415,994	951,858	827,258	15·2	34·9	30·3

NOTE.—The Population was estimated in the following manner: To the population of Italy, exclusive of Venetia, according to the census on 31st December 1861, was added the population of Venetia, according to the Austrian census in 1858, and also the excess of Births over Deaths in each year. No correction was made either for immigration or emigration. The population for 1871 is that enumerated at the census on the last day of December 1871. The population of Rome was first included with that of the kingdom of Italy in 1872.

* Census year.

† The decrease of marriages in 1866 may be attributed to the law, which then came into operation, introducing civil marriage and rendering the church marriages of no legal effect. There had been a marked increase in 1865 resulting from a wish to evade the law about to come into operation. After the 1st of January 1866 the marriages solemnized only in the churches, not being legally recognised, escaped registration; their number, which was very great in 1865 and the following year, is happily decreasing.

TABLE 75.—Changes in the Constitution of the Superintendent Registrars' Districts and Registration Sub-districts during the Year 1874.

[The Name of the District is in SMALL CAPITALS, that of the Sub-district in *Italics*. The figures in Cols. 1. and 4. show the number of the District.]

Superintendent Registrar's DISTRICT and Registrar's <i>Sub-district</i> from which a Transference was made.	Date of Change.	Place and Population (1871) transferred from the District in Column 1 to the District in Column 4.	Superintendent Registrar's DIST and Registrar's <i>Sub-district</i> to which addition was made.

NOTE.—The population in the four years 1862-65 and in the years 1867-69 was estimated by means of the average annual rate of increase observed between the two enumerations of 1861 and 1866. The returns since the year 1860 include the three newly annexed departments. The deaths of Frenchmen abroad, civil or military, are registered in the books of the Commune in which they were last domiciled.

* Census years.

† Cholera was prevalent in 1865-66, and war raged in 1870 and 1871.

1873*	—	—	—	—	—	—	—	—
1874*	—	—	—	—	—	—	—	—

NOTE.—The Population enumerated at the Census of 1860 was 15,873,536. The estimated Population for the Years subsequent to 1861 has been deduced from the Excess of Births over Deaths in each Year. The decline of registered marriages in 1870 is believed to be due to the introduction of civil registration, which occurred during that year.

* No figures have been received for years subsequent to 1870, in consequence of the disturbed condition of the country.

* The present number of Superintendent Registrars' Districts is 627. The above numerical arrangement, 1 to 627, was adopted on 1st January 1871. One new Superintendent Registrar's District, viz., 467 a, Prestwich, has been formed, and Shrewsbury, No. 132, has been incorporated with Aitcham, 351.

Ages of Persons Married in 1874.

AGES OF 299,696 PERSONS WHO WERE MARRIED IN ENGLAND IN THE YEAR 1874.

The Total Number of MARRIAGES registered in England in the Year 1874 was 202,010; the Ages of both Parties were specified in 149,848 instances. In the other 52,162 cases the column of the Register headed "Ages" is filled in by the Officiating Minister or by the Registrar of Marriages with the words "of full Age," "Minor," "Under Age," as the case may be.

AGES OF 149,848 MEN and 149,848 WOMEN married in England in the Year 1874.

* The Registration Counties consist of groups of Superintendent Registrars' Districts, which are generally co-extensive with the Poor Law Unions. Those Districts which extend into two or more Counties (proper) are included entirely in that County in which the principal part of the District, or the greater part of the population, is located. The boundaries of the Registration Counties therefore differ more or less from the boundaries of the Counties (proper).

† These figures have been furnished to the Registrar General by the Ordnance Survey Department. They do not include space occupied by foreshore or tidal water of rivers and creeks.

‡ Some of the births—especially of illegitimate children in London and large towns—escape registration.

Abstract of Marriages, Births, and Deaths, 1874.

* The Districts are collections of contiguous Parishes or Places combined for purposes connected with the Registration of Births, Deaths, and Marriages, and are nearly always identical with the Poor Law Unions of the same names: they are arranged according to their local position under the Registration Counties. The presence of Institutions in any District is indicated in this column of the Table by H for Hospital or Infirmary, L for Lunatic Asylum, and W for Workhouse Establishment receiving inmates from other Districts than the one in which it stands: and repetitions of these letters show the number of such Institutions in any District.

† Wherever the minus sign is prefixed to the number in the column headed "Excess of Births over Deaths," it denotes that the Births in the District, instead of exceeding the Deaths, were, in fact, less than the Deaths to the extent stated.

II.—SOUTH EASTERN COUNTIES.—MARRIAGES, BIRTHS, AND DEATHS, 1874.—DISTRICTS—continued.

* The Sub-districts are sub-divisions of Districts, and comprise the Parishes or Places in which the Births and Deaths are registered by Registrars severally appointed for that purpose. The letter W denotes that the Sub-district contains within its limits a Workhouse Establishment belonging to the District or Union W indicates that Workhouse Establishment receiving inmates from other Districts than the one in which it stands is included. H indicates a Hospital or Infirmary. L a Lunatic Asylum and repetitions of any of these letters show the number of such Institutions in each Registration Sub-district.

† Wherever the minus sign - is prefixed to the numbers given in the Column headed "Excess of Births over Deaths," it denotes that the Births in the Sub-district, instead of exceeding the Deaths, were, in fact, less than the Deaths to the extent stated. The Excess of Deaths over Births is often attributable to the mortality in Institutions. The Deaths in the principal Institutions of England in 1874 are given on pages 99-115.

* The Sub-districts of Newton, Cheetham, Fallowfield, Blackley, and Prestwich (467a, 1-5) which on 1st October 1874 were constituted a Superintendent Registrar's District, were prior to that date part of Manchester District (467). In this table of Births and Deaths the facts are inserted as if the alteration had taken place on 1st January 1874.

VIII.—NORTH WESTERN COUNTIES.—BIRTHS AND DEATHS, 1874—SUB-DISTRICTS—continued.

SUB-DISTRICTS.		AREA in Statute Acres.	POPULATION, 1871.	TOTAL		BIRTHS.				DEATHS.		Excess of Births over Deaths.	
				BIRTHS.	DEATHS.	Including Illegitimate Births.		Illegitimate Births.		Males.	Females.		
						Males.	Females.	Males.	Females.

DEATHS IN PUBLIC INSTITUTIONS,

1874.

THE FOLLOWING PAGES contain the numbers of deaths registered during 1874 in most of the public institutions of England. These figures will afford the means of correcting the mortality of districts and sub-districts where affected by the situation therein of these institutions, through the deaths recorded in them. The following list includes Workhouses, Hospitals, Infirmaries, and public Lunatic Asylums, while prisons, almshouses, schools, private lunatic asylums and benevolent asylums, are excluded. The list, as settled, includes 1338 institutions; of which 715 are Workhouses, Workhouse Infirmaries, or Workhouse Schools; 544 Hospitals or Infirmaries; and 79 Lunatic Asylums. The Lunatic Asylums are mostly County Asylums, but a few private Asylums which receive pauper patients are also included. In these 1338 institutions 45,865 deaths were registered during the year, or 8·7 per cent. of the total deaths in England and Wales, against 9·0 per cent. in the preceding year; 29,415 occurred in Workhouses, 11,963 in Hospitals, and 4487 in Lunatic Asylums. Each of these totals exceeded the corresponding numbers in 1873, and the proportion to total deaths was 5·5 in Workhouses, 2·3 in Hospitals, and 0·9 in Lunatic Asylums.

Deaths registered in Public Institutions of England in the Year 1874.

CAUSES OF DEATH at different Periods of Life, in the Year 1874.

would not materially interfere with the calculated proportions. Where it is desired, partial correction, however, can be made by means of the following Supplementary Table, containing the deaths from many distinct diseases, such as chicken-pox, mumps, &c. &c., which in the preceding Tables, have no separate classification, and also many of the deaths from various forms of disease (such as softening of the brain, *necrencephalus*, deaths from which are included under "*Brain Disease, &c.*") which in some cases are returned under other heads.]

ENGLAND.—SUPPLEMENTARY TABLE of the

[The principles upon which the Causes of Death are tabled have been explained in previous Annual Reports. It will be sufficient to state now that all Diseases are classified in the Tables of Causes of Death, pp. 146-149, under 116 heads; some of these heads, however, include groups of diseases which are very distinct from one another, but which either are fatal to only a few persons, or are often confounded with other diseases. The rule has been to refer the distinct diseases to heads under which the cases were so numerous, that the additional number

APPENDIX.

CONTENTS OF APPENDIX.

LETTER to the REGISTRAR GENERAL on the CAUSES of DEATH in ENGLAND	Page.
in 1874, by WILLIAM FARR, Esq., M.D., F.R.S.	219
TABLES (MISCELLANEOUS)	225
TABLE of CAUSES OF DEATH in ENGLAND in 1874, classified in accordance with the NOMENCLATURE drawn up by a COMMITTEE appointed by the ROYAL COLLEGE OF PHYSICIANS OF LONDON	254

APPENDIX.

LETTER to the REGISTRAR GENERAL on the CAUSES of DEATH in
ENGLAND, by W. FARR, Esq., M.D., F.R.S.

YEAR 1874.

SIR,

THE causes of death recur in these ages with great constancy. None of those great plagues which once swept away so many thousands of the people of England have been recently observed. At the same time, in modified forms, all the diseases that have been recorded in medical history remain; they are not easily stamped out; they are fatal year after year to certain numbers, and have to be kept under constant observation. The increase of population, the extension of navigation, the new industries, the marvellous chemical operations going on, the explosive forces, the machines, and the power of steam, every year in increased activity, have developed dangers unknown in other days; and have to be encountered by new remedies. Then nations are now so associated by intercourse that a disease generated among the lowest races in unfavourable conditions may spread to every other race, and carry off many victims.

I.—ZYMOTIC DISEASES.

Diphtheria, which first appeared in the Tables under a separate heading in 1855, was fatal to 3560 persons. It attacks children, but after the age of 45 it is more fatal than scarlet fever. This disease has a distinct character; and has existed, Dr. W. Squire asserts, from the earliest ages of medical history.* He finds the first recorded case in Hippocrates (Epid. lib. v.). Aretæus describes it. Fothergill calls it, in his remarkable Essay, sore throat with ulcers. Bretonneau investigated the epidemic at Tours in 1818; and it has since that been well known. Before the publication of his book it had not found so distinct a place in the nosology. The severe epidemic of France in 1855-7 reached England apparently through Boulogne. The disease afterwards appeared in the returns under the name of diphtheria, which Bretonneau had given it. Before it had been called putrid sore throat, or *cynanche maligna*; and it had no doubt often been confounded with scarlet fever, or croup. *Cynanche maligna* still occurs in the returns; but cases so returned are classed under diphtheria, with which it is really synonymous.

It is a remarkable fact that of diphtheria, out of the same number born more die in the healthy districts of England than in Liverpool:† the proportions are 1029 in the healthy districts and 442 in Liverpool out of 100,000 born.

The deaths from scarlet fever are 2140 in the healthy districts to 3830 in Liverpool; thus reversing the other proportions.‡ The population of

* See the able article of Dr. W. Squire, L.R.C.P., in Reynolds' System of Medicine (vol. I., p. 370), for an excellent summary of all that is known of this disease.

† For years 1861-70, see Supplement to Registrar-General's 35th Report, p. exii.

‡ See Tables in Supplement to 35th Report.

the South Eastern Division is not more than two-thirds of the population of London; and yet the deaths from diphtheria (456) exceeded the deaths from that disease (419) in London. In Wales the deaths from diphtheria (340), in proportion to population, exceed the average. Generally it is more fatal where there are offensive privies than in towns with waterclosets; but cases are found in the year in variable numbers in every county, and almost in every district. Diphtheria is one of the diseases that should be carefully investigated. Sometimes it sweeps away several children of the same family.

Scarlet fever, alike in its mild and malignant forms as in its various complications, is now one of the zymotic diseases very fatal to young children. It is most fatal during the second, third, and fourth years; it pursues them relentlessly up to the tenth year; and fatal cases occur afterwards through life. The corrected mean age at death is 5·8 years; that from fatal measles being only 2·7, from whooping-cough 1·8 years.* In the year before us the deaths from scarlet fever were 24,922. Deaths occurred in the greater part of the districts of the kingdom: they can be traced in the tables, pp. 184-195. London suffered severely: the deaths were 2648. The Southern and Eastern Divisions had not many deaths. In the West Midland Division, Birmingham and parts of Staffordshire were the most conspicuous sufferers. Lancashire lost 6404 lives by this single disease, the West Riding of York 3779, Durham 1942, and South Wales 1388. The visitation was severe in the mining districts. The mean rate of mortality by scarlet fever was 1062 deaths to 1,000,000 of the population of the whole country; which is slightly above the average of the 25 years 1850-74: it was below the mortality (1461) in 1870, and was as high as the mortality of the two previous years.

Measles was more fatal than it is on the average; it was the cause of 12,255 deaths, a number rather in excess of the deaths by whooping-cough, 10,362. But the two diseases together are less fatal than scarlet fever.

Fever is now distinguished under its three forms of typhus, enteric, and simple continued. It has been proved beyond doubt that enteric fever (typhoid), often called typhoid fever, is a distinct disease from typhus, with which it was confounded not only in the early history of medicine but late in the present century: the labors of the accurate Louis, of Dr. A. Patrick Stewart, Sir W. Jenner, and Dr. Murchison, have now distinguished enteric fever. No case of relapsing or famine fever has been returned in the year. The deaths by fever of the three forms were 13,735; by typhus 1762, by enteric fever 8861, and by simple continued fever 3112. The mortality to 1,000,000 living by fever in 1850-4 was at the rate of 995; and gradually fell to 657 in the five years 1870-4. The rate of mortality by typhus in the year 1869, when the three forms were first distinguished, was 197, 148 in 1870, 122 in 1871, and only 81, 71, 75 in the three years following. Thus typhus has declined; so has simple continued fever. Enteric fever, evidently due to a distinct cause, shows no symptom of decline in the corresponding years. Diarrhœa, in some points allied to enteric fever, is now more fatal than it was 20 years ago. It prevails chiefly in the heat of summer when the temperature of air and water rises above 60° Fahrenheit. It is not improbable that the mixture of sewage in water tends to spread this disease among children, to whom it is most fatal. Of the 21,204 deaths by diarrhœa, 18,024 occurred among children under 5 years of age. Cholera has only prevailed in the simple form, and has been fatal to few.

Rheumatic fever is a very serious disease in itself, and the consequential effects it leaves behind it in affections of the heart are of the most serious character. Unlike other zymotic diseases, it occurs chiefly in adults, and one attack leaves an increased liability to a second. Of the 3203 persons

* See Supplement to Registrar-General's 35th Report, p. xxxvii.

whose deaths were referred to rheumatism, 2981 were over 10 years of age; 1510 were males, 1471 females; at the ages 10 to 15, 20 to 25, rheumatism is the most fatal. It has most affinity to ague and remittent fever.

Enthetic diseases are produced by inoculation of specific matter. Those of most frequent occurrence are syphilis, gonorrhœa (and its consequence stricture,) hydrophobia, and glanders. Glanders is communicated by the horse, hydrophobia by the dog, to man. Glanders was fatal to four men; the deaths from this cause we may hope will be diminished as the men employed about horses grow more cautious. Hydrophobia was fatal to 61 persons; namely, to 49 males and 12 females; four were children under 5 years of age, eight were boys of 5-10; three were boys, three were girls, of 10-20; six were young men, one a young woman, of 20-25; 29 were men, seven women, of 25 and upwards. Hydrophobia, notwithstanding police regulations, is twice as fatal as it was 20 years ago.

Syphilis is communicated not by animals, but by men and women themselves afflicted by disease; and it was, as far as it was recorded, twice as fatal in the five years 1870-74 as it was 20 years ago. Its most fatal recorded forms occur in children under one year of age. Thus, of nearly 2000 deaths ascribed to syphilis, 1484 were babies under one year of age; of whom 770 were boys, 714 girls.

Special provision is required to prevent the diffusion of this disease; and there can be no doubt that the only effectual provision is reclusion of the sources of infection in infirmaries under well considered regulations.

Alcoholism became less fatal year by year until 1873. The deaths to 1,000,000 living by delirium tremens in the successive quinquennials, from 1850 to 1874, were 29, 26, 24, 22, 16: the last year, 1874, delirium tremens broke out again with renewed violence, and the rate reverted to 21; while the deaths ascribed to intemperance, which had on an average been 17, rose to 24. The death-rate from alcoholism in both forms was higher than it had been for some years.

II.—CONSTITUTIONAL DISEASES.

84,119 deaths were ascribed to constitutional diseases; namely, 17,791 to diseases of the diathetic order, and 66,328 to tubercular diseases, including scrofula, mesenteric disease, hydrocephalus, and phthisis. Among the diathetic diseases gout still holds its own: to it 542 deaths are directly referred. The proportion to 1,000,000 living that died of gout annually ranged from 12 to 13 in the three quinquennials 1850-64. In 1865-69 the proportion rose to 18; in the five years 1870-74 to 21, 20, 20, 20, and 23. As is usual, the men suffer more than the women from gout; and the greatest number of deaths from gout in any decenniad of age occur at 65-75.

Cancer, one of the longest and most painful diseases to which mankind is subject, is growing more fatal. To it 4586 deaths were referred in 1847, 5826 in 1854, 8117 in 1864, and 11,011 in 1874. The proportion of annual deaths to 1,000,000 living was 302 in 1850-54, and 443 in 1870-74. The diagnosis of internal cancer has no doubt made considerable progress, and some cases which were formerly vaguely returned as tumors are now recognized as cancer in some of its forms; but the increase of cancer demands all the attention of pathologists. Great will be the merit of the physician who discovers how its attacks can be warded off, or its ravages arrested. It is worthy of note that of its victims 3470 are males, 7541 are females; and that the young are spared; most of the deaths occurring at ages above 45, when the reproductive forces have subsided. Under 45 years of age the number of deaths of males by cancer was 479, slightly in excess of the 427 deaths of females. At ages over 45 the deaths of males were 2991, of females 7114. The forces that

had been expended, especially in the female, in building up normal organizations were diverted towards heterologous structures. The breasts, the uterus, the glands are the most common seats of scirrhus disease. The hæmatoid disease is most frequent in children.

The tubercular diseases show some signs of subsidence. The mortality from this order of diseases is sensibly declining; while consumption, the most fatal of the diseases of the prime of life, destroyed in 1,000,000 living 2811 a year in the years 1850-54, it destroyed 2283 a year in 1870-74. During these last five years the decrease has still been going on; it was at the rate of 2435 in 1870, and 2104 in 1875.

III.—LOCAL DISEASES.

226,617 persons died of local diseases; including 68,014 of diseases of the nervous system; 29,956 of diseases of the organs of circulation; 90,612 of diseases of the respiratory organs; and 23,917 of diseases of the digestive organs. There is a general increase in the deaths from all these orders of diseases. The increase in the fatal diseases of the circulatory organs is the greatest; next come diseases of the respiratory organs; the fatal diseases of the nervous system increased to some extent; those of the digestive organs declined in 1870-74.

While the rate of mortality from consumption and pneumonia declined, the mortality from bronchitis rapidly increased.

IV.—DEVELOPMENTAL DISEASES.

These diseases are incidental to the stages of development, nutrition, growth, and decay. To them 78,874 deaths were referred. They include 10,527 deaths of children prematurely born; 1496 of children malformed; 4317 of children dying in the process of teething; all of them under 5 years of age, and nearly all of them under 2 years of age, the boys dying in greater numbers than the girls.

Of the second order only women died: 116 died of paramenia; 2819 of diseases incidental to child-bearing; the greater part of them at the ages 25-45. One girl, the daughter of a laborer, died of childbirth at the age of 14. The case is well authenticated.

If we add the 3108 deaths from puerperal fever (metria) the total deaths referable to child-bearing was 5927. This implies 1 death of the mother to every 140 children born alive.

Of old age 12,495 men, and 16,109 women died, all over 65 years, and some over 100 years. Thus of 526,632 deaths no less than 498,028 were referred to injuries, diseases, and evident organic imperfections; 28,604 to old age.

A rather greater number, or 30,995 deaths, chiefly of young children, were referred to atrophy and debility.

V.—VIOLENT DEATHS.

17,920 persons died violent deaths in the year 1874. Happily in England none died in battle. 15,667 deaths were referred to accident or negligence; 409 to homicide; 1592 to suicide; and 18 to execution. The number of executions registered in the year is double the average. We have to go back to the years 1863-4 to find greater numbers.

13,414 males and 4506 females died violent deaths; so to one female three males are killed. 3978 of the number were children under 5 years of age: 2,232 were boys, 1746 were girls. As age advances the excess of deaths of males over deaths of females increases. Thus at the age 5-10 the deaths of boys by violence are 742, of girls 391, while at the

age 25-35 the deaths of men by violence are 1758, of women 233. At this stage of civilisation the men bear the brunt of the battle.

The causes of violent deaths are analysed in the Tables (pp. 196-216), which are in continuation of the Tables in previous Reports. Thus 1165 males and 84 females were killed on railways in some way or other. Of the males 743 are returned as having been run over on the line; 26 were killed by collision; 175 were crushed by carriages or engines. These deaths are now returned more accurately and completely than they were formerly to the Board of Trade; but it may be of use to give here the total deaths on railways from the time when they were distinguished in the annual reports of this office.

The following Table shows how rapidly the deaths on railways have increased since 1863. It is right to state that the number of miles of railway opened were 7,001 in 1858, 10,850 in 1871, and 11,622 in 1874. The receipts from passengers were 8,789,181*l.*, 15,476,126*l.*, and 18,774,836*l.* in the corresponding years.

DEATHS CONNECTED WITH RAILWAYS.

Years.	Males.	Females.	Total.
1863	607	40	647
1864	745	51	796
1865	885	62	947
1866	837	71	908
1867	822	55	877
1868	714	83	797
1869	785	56	791
1870	861	69	930
1871	1,042	84	1,126
1872	1,068	92	1,160
1873	1,185	105	1,290
1874	1,165	84	1,249
Total in 12 years, } 1863-74 - }	10,666	852	11,518
Annual Average -	888·8	71·0	959·8

Thus, if we take the receipts as an indication, it is probable that the passenger traffic has increased faster than the deaths of passengers, railway workmen, and strangers to the line. It is none the less true that there has been an absolute increase of violent deaths to the extent of 1249 in a year; deaths which would not have happened had no railways existed.

1313 persons were killed by horse conveyances, namely, 1113 males and 200 females. Carts, vans, and waggons are the great offenders. The tram-cars evidently require great care in their management; although they are not in such general use, they killed more people (62) than omnibuses (55). By cabs 61 persons were killed; by carriages 82; and this limitation of the numbers implies great skill on the part of the drivers in streets often crowded.

The deaths of males from injuries of various kinds in coal mines were 938, of females 4. From injuries connected with copper, tin, iron, and other mines 118 men died.

The total deaths referred directly to mechanical violence were 6,464, which have been classified, as far as the returns admitted of it, under several heads.

To chemical injuries the deaths of 1568 males and 1432 females are referred. By burns 610 males, 888 females died; the manner not being

stated in the great majority of cases. Still, it is evident that more women than men die by the clothes taking fire; for 300 deaths of females against 163 deaths of males are explicitly referred to this cause. Under five years of age the deaths of boys by burns are 338, of girls 298. At that age when the dress of many boys is as combustible as the dress of girls, the more daring sex die in greater numbers than girls.

Children in some numbers are killed every year by drinking scalding water too carelessly left in their way; 20 boys and 13 girls so died in 1874. The boys and girls, 33 in number, were thus distributed as to age; 8 were 1-2; 13 were 2-3; 5 were 3-4; 4 were 4-5; 2 were 5-10; and 1 was 10-15. The age of 2 and under 3 is that at which the young ones are just able to go about without help, and are yet uninstructed by experience how to avoid dangers.

395 males, including 305 under five years of age; and 297 females, including 263 under five years of age, were scalded to death under circumstances not defined.

86 persons, 73 males and 13 females, were destroyed by burns, scalds, and shocks of explosion; 30 by gunpowder, 3 by fireworks, 14 by gases, 1 by dynamite, 26 by steam, and 12 by ways not described. This is exclusive of 24 deaths directly referred to explosion of steam boilers.

25 boys and men were killed by lightning; nearly all following out-of-door occupations. No woman was killed by lightning.

Sunstroke was fatal to 71 males and to 19 females.

Cold on the other hand was fatal to many. 90 deaths of males and 24 of females were ascribed to "gelatio and exposure to cold." There were 17 of the number under five years of age; but the majority (48) were fifty-five years of age and upwards.

Deaths by poisoning increased in 1874; of 461 cases of such deaths 149 were suicides, and 312 were deaths by accident or negligence, murder or manslaughter. Thus, about one case in three deaths by poisoning were ascertained suicides.

2891 deaths by drowning inland or on the coast are recorded. This is exclusive of the cases of drowning out at sea and abroad.

I have previously noted the rapid increase of deaths by suffocation, to which 1560 deaths were ascribed in the year. The mode of suffocation is not stated in 346 cases; 73 persons were choked by food; 586 were smothered under the bed clothing, and 240 were overlaid.

The fact is certain; and the cause of the increase requires thorough investigation. The coroner of Newcastle-upon-Tyne, Mr. John T. Hoyle, thus writes to the Registrar General: "During the past six months I have held 'twenty inquests where medical witnesses proved deaths by suffocation.' He calls the Registrar General's attention 'to the circumstances which usually attend the sudden deaths of children, which have been very frequent of late years in the borough.'" "In a great many cases it turns out, on an inquest being held, that the children have been accidentally suffocated in bed by the parents, very frequently either one or both of them, going to bed in a state of intoxication." Here is another evil to be referred to the evil effects of excessive drinking.

I have the honor to be,

Sir,

Your obedient servant,

WILLIAM FARR.

To
The Registrar General.

* The rates given in this Table for the various groups of years are the means of the calculated rates in the several years, & the separate headings the means cannot be given for the entire period, as the classification in full detail has not been made for 25 years. In a certain number of cases in each year the cause of death is not stated; in calculating the proportional rates these have been distributed rateably over all the causes in the Table.

† Order 2, comprising Violent Deaths in Battle, is omitted, as inapplicable to the civil population.

‡ Average in

TABLE 2.* (continued).—Mean Annual Rate of Mortality in England from each CLASS of CAUSES and from each CAUSE of DEATH during the 25 Years 1850-74, and in each Quinquenniad of the Period; also the Rate of Mortality in the Years 1870, 1871, 1872, 1873, and 1874.

* The populations of these counties have been estimated to the middle of 1874 on the assumption that the rate of increase or decrease which prevailed between the two census enumerations in 1861 and 1871 was maintained up to the middle of 1874; the county totals were then adjusted in order to cast to the estimated total population of England and Wales.

INDEX OF DISTRICTS.

[The following Index furnishes a reference to the *Number* of each REGISTRATION DISTRICT in the topographical arrangement adopted in the Tables of Abstracts contained in the Report. The alphabetical arrangement places compound names in the order in which they are pronounced: thus, East Ashford will be found under the letter E, and not under A.]

In consequence of numerous alterations (amalgamations of districts and formations of new districts) since the numerical arrangement, 1 to 623, was adopted in the Abstracts for the year 1847, the districts were re-numbered consecutively from 1 to 627 in the Abstracts for the year 1871.*

For names of Towns, such as Leamington, Torquay, &c., which are not found in this "Index of Districts," see the "Index of Sub-districts" (page 271) and "Index of certain Towns" (page 281).

INDEX OF SUB-DISTRICTS.

This alphabetical arrangement places the Registration Sub-Districts (or Registrars' Districts) having *common names* in the order indicated by the usual pronunciation of those names; thus, East Grinstead will be found under the letter E, and not under G; St. James under the letter S, and not as "James, St." The number against each Sub-District, in the third column, refers to its numerical place in the Tables Abstracts; thus, Abbey Holme (570; 2) is the 2d Sub-District of the Wigton District, No. 570.]

SUB-DISTRICT.	DISTRICT.	No.	SUB-DISTRICT.	DISTRICT.	No.	SUB-DISTRICT.	DISTRICT.	No.
A			Ardleigh . . .	Tendring . . .	194; 5	Baschurch . . .	Ellesmere . . .	354; 4
